

CDM Initiative Resources

(Updated November 2008)

The CDM System Health Management Initiative is led by the DMTF's CDM Forum to drive industry wide adoption of CDM by providing the ability for the industry to develop interoperable health management solutions based on CDM. Key elements of the initiative include compliance testing tools, use cases and profiles, as well as a certification program.

Via CDM technology, Independent Hardware Vendors (IHVs) will no longer need to develop unique diagnostic solutions for their various customers, reducing their diagnostic development investment. In addition, Independent Software Vendors (ISVs) will benefit by having a single vehicle to deliver adaptive software systems, and Original Equipment Manufacturers (OEMs) will benefit by having an improved level of support from their vendors.
