Use the Redfish Resource Explorer (redfish.dmtf.org) to explore the resource map

GET http://<ip-addr>/redfish/v1/Systems/{id}/Processors/{id}
PMCI WG developing a standard to enable a server Management Controller to present a Redfish-conformant management of I/O Adapters in a server without building in code specific to each adapter family/vendor/model.

- Support adapter “self-contained, self-describing” including value-add (OEM) properties
- New managed devices (and device classes) do not require Management Controller firmware updates
- Support a range of capabilities from primitive to advanced devices (lightweight/low bandwidth options)
- Leveraging PLDM, a provider architecture is being specified that can binary encode the data in a small enough format for devices to understand and support.
- MC acts as a proxy to encode/decode the data to/from the provider
- PLDM works over I2C & PCIe VDM. Additional mappings under consideration.
Redfish Device Enablement (RDE)

- **Standard Redfish**
  - Transport for communication: HTTP/HTTPS
  - Payload for configuration: JSON

- **The Challenge**
  - HTTP servers require a lot of code and computation
  - JSON is a verbose protocol designed for human readability
    - Large message payloads, lots of space consumed in property names
    - Flexible layout: no defined order for properties
  - Devices have limited capabilities
    - Small memory footprint, limited processing capabilities
    - Can’t handle raw JSON
  - Need a way to make the payloads manageable for devices
RDE: The Solution

- **Redfish Device Enablement**
  - Make the cat smaller!
  - Transport for communication: PLDM
  - Payload for configuration: BEJ

- **PLDM**
  - Platform level data model, a low level messaging system that runs over a variety of system level buses
    - I2C/SMBus and PCIeVDM over MCTP
    - RBT over NC-SI
  - Supports topologies, eventing, discovery

- **Binary Encoded JSON (BEJ)**
  - Replace long identifier strings in JSON text with short sequence numbers
  - Dictionary enables lookup between sequence numbers and strings
  - Roughly a 10x compression!
PMCI Hierarchy for Redfish Services

PLDM Layers
- SMBIOS
- Monitoring and Control
- BIOS Ctrl and Config
- FRU Data
- Firmware Update
- Redfish Device Enablement

Upper Layers
- NVMe Mgmt I/F
- PLDM
- MCTP Ctrl
- Network Controller Sideband Interface (NC-SI)

Transport Layers
- Management Component Transport Protocol (MCTP)
  - MCTP/SMBus
  - MCTP/Serial
  - MCTP/PCle VDM
- RMII Based Transport (RBT)

Physical Layers
- SMBus
- Serial
- PCle VDM
- RMII
RDE Architecture

- **Roles**
  - Client: uses standard JSON over HTTP/S
  - Management Controller (MC): translates between client and device
  - Device: hosts data, uses BEJ over PLDM

- RDE splits Redfish support between the device and the MC
- Client unaware that device does not talk native Redfish
  - Ensures compatibility and supportability

Next Up: Discovery and Registration

• Overview
• Discovery and Registration
  • Schemas and Redfish Resource PDRs
• Operations
• Advanced Topics: Binary Encoded JSON (BEJ)
  • Dictionary Preparation
  • Encoding Example
  • Decoding Example
• Advanced Topics: Tasks
• Advanced Topics: Eventing
RDE Device Discovery

1. MC detects presence of device and that it supports PLDM (such as via MCTP Get Message Type Support command)

2. MC confirms that device supports both Monitoring and Control (type 2) and Redfish Device Enablement (type 6) via PLDM GetPLDMTypes command

3. MC confirms that device supports appropriate PLDM base, M&C, and Redfish commands via PLDM GetPLDMCommands command

4. MC uses RDE NegotiateRedfishParameters command to perform initial handshake with device, resolving:
   a) Concurrency: How many pending operations can the device manage at once?
   b) Supported Operations
   c) Device Redfish provider name

5. For each communication channel the MC wants to talk to the device on, it uses the RDE NegotiateChannelParameters command, resolving:
   a) Asynchrony support: Will the device issue asynchronous alerts for Operation completion or Redfish Events?
   b) Maximum transfer chunk size: how much data can be sent at once?
RDE Device Registration

1. MC queries device for its Platform Data Records (PDRs)
   a. PLDM GetPDRRepositoryInfo command gets total number of PDRs
   b. PLDM GetPDR commands retrieve each Redfish Resource PDR
   c. Redfish Entity Association PDRs capture some logical links between resources
   d. Redfish Action PDRs detail custom actions supported by device

2. MC gets schema IDs and versions from the Redfish Resource PDRs
   a. Retrieving just the identities (names) of the schemas, not the full textual schema contents.
   b. Can retrieve binary dictionary to get translation info for schema via GetSchemaDictionary command
   c. Dictionary includes standard schema data and OEM extensions
   d. Dictionaries may be stripped down to list just those fields that the device supports

3. MC offers management data (by proxy) for the device
   a. MC acts as translating provider on behalf of device
   b. External client management utility (“client”) won’t know it isn’t talking directly to the device

4. Client locates MC provider via standard Redfish techniques
Next Up: Schemas and PDRs

- Overview
- Discovery and Registration
  - Schemas and Redfish Resource PDRs
- Operations
- Advanced Topics: Binary Encoded JSON (BEJ)
  - Dictionary Preparation
  - Encoding Example
  - Decoding Example
- Advanced Topics: Tasks
- Advanced Topics: Eventing
Redfish Resource PDRs

- New PDR type to encapsulate the data for a resource
- Each PDR represents one instance of the data
  - Many-to-one relationship between PDRs and schemas
  - One-to-one relationship between PDRs and resources
- Device lines up schemas to correspond to the management topology it wants to expose
- Topology determined jointly by device and MC
  - MC exposes outer (top levels) of the topology
  - Device builds component trees that hook into the structure built by the MC
  - Component trees are linked internally via the containerID field that identifies parent for each resource. Parent of SYSTEM means it hooks to the MC’s structure
  - Device suggests where to place its component trees, but MC gets final say
- Formal URIs for schemas can be retrieved via GetSchemaURI command
Redfish Entity Association PDRs

- Usually not needed since linking is implicit in Redfish Resource PDRs
- Links between resources internal to devices can just be supplied in response to reads via the Links section of the resource schema
- Primarily needed when a resource inside the device is a related resource for a resource outside the device
- Connection to MC’s resource topology works same as for Redfish Resource PDR
Disk Subsystem (Physical Layout)

RAID Array Controller *

Disk Volume 0
- Disk 0
- Disk 1
- Disk 2
- Disk 3

* For this example, we’re assuming that the raid array controller firmware exposes management for everything seen here
Server Storage in Redfish

Note that the Volumes are in Collections off of the Storage resource, drives are in arrays off of the storage resource and optionally the Chassis.

Next Up: Binary Encoded JSON

- Overview
- Discovery and Registration
  - Schemas and Redfish Resource PDRs
- Operations
- Advanced Topics: Binary Encoded JSON (BEJ)
  - Dictionary Preparation
  - Encoding Example
  - Decoding Example
- Advanced Topics: Tasks
- Advanced Topics: Eventing
Binary Encoded JSON (BEJ)

- Compact binary format for self-describing encoding of multiformat data
- Separates the string labels of the data from the data itself
  - Property names and enumeration strings are static, don’t need to be part of the encoding as long as we can systematically restore them later
  - We’ll put them into a separate “dictionary” and refer to them by “sequence numbers”
  - Requires that sequence numbers be well-defined. JSON not ordered, so we’ll have to impose a canonical ordering on it
- Comparable to ASN.1, but simpler to deal with
  - Providing sequence number AND format for each tuple eliminates need for context-aware decoding
  - Adding counts for sets and arrays enables preallocation of memory for decoded contents without requiring an additional pass through the data
  - Less state required to decode
  - Directly tied to JSON, so we can skip some of the exotic ASN.1 formats and reuse high bits in the format byte as flags
  - Easier to implement: 2 days for BEJ encoder/decoder vs a month for ASN.1
BEJ and Redfish Schemas

- BEJ encoding details for individual Redfish schemas can be captured in dictionaries
  - Everyone has to agree to use the same dictionaries or this doesn’t work
  - Standardized procedure for generating dictionaries ensures that everyone works with the same dictionary
  - Code to create dictionaries will be created and made open source
  - Dictionaries can be made publicly available on DMTF publicly available website
  - Dictionaries can be defined once, when schemas are defined
    - By DMTF in the case of standard schemas
    - By OEMs in the case of OEM schemas
  - Dictionaries are static: once revisions are defined, no runtime changes

- Dictionaries do not cross Redfish schema boundaries
  - 1:1 mapping from dictionaries to Redfish schemas
  - Data for distinct schemas is stored in distinct dictionaries
  - Dictionaries are consistent from version to version of Redfish schemas by design of sequence number assignment
  - Dictionaries are never exposed to Redfish clients; they are internal between devices and MCs
Building Dictionaries from Redfish Schemas for BEJ

- Example: Dummy Simple Schema (artificial, fits in slide)
- Prep work: done before or as part of compiling MC/device firmware

1. Canonicalize Redfish schema
   a. Expand reference properties to get all schema data into one place
   b. External schema links get placeholders (that ultimately will map to other PDRs)
   c. Put in alphabetical order (by rev) within each layer of the hierarchy
      a. fields/enum values added for initial version of the Redfish schema are sorted
      b. fields/enum values added for each subsequent version are sorted and appended to the list from the previous
      c. sequence numbers for fields/enum values removed from previous versions of the Redfish schema are never reused
      d. this ensures that sequence numbers never change across versions over the life of a Redfish schema
   d. Insert sequence number annotations
      a. in increasing order within each level of the hierarchy, starting at 0

2. Collect canonicalized schema data into dictionary for use with BEJ
Basic Schema (translated to a compact format)

```xml
<Schema url="http://redfish.dmtf.org/.../redfish-schema.v1_1_0.json"
      title="DummySimpleSchema" version="1.2.0">
  <Item name="DummySimple" type="set">
    <Link name="Id" ref="http://redfish.dmtf.org/.../definitions/Id"/>
    <Item name="SampleIntegerProperty" type="number" readonly="no" optional="no"/>
    <Item name="SupportEnabledProperty" type="boolean" readonly="yes" optional="yes"/>
    <Item name="ChildArrayProperty" type="array">
      <Link name="" ref="http://redfish.dmtf.org/.../definitions/ChildArray"/>
    </Item>
  </Item>
</Item>
</Schema>

<Schema url="http://redfish.dmtf.org/schemas/v1/Resource.json#/definitions/Id"
      title="IdSchema" version="1.0.0">
  <Item name="Id" type="string" readonly="yes" optional="no"/>
</Item>
</Schema>

<Schema url="http://redfish.dmtf.org/.../redfish-schema.v1_1_0.json"
      title="ChildArraySchema" version="1.0.0">
  <Item name="ChildArray" type="set">
    <Item name="LinkStatus" type="enum" enumtype="String" readonly="yes" optional="no">
      <Enumeration value="LinkUp"/>
      <Enumeration value="NoLink"/>
      <Enumeration value="LinkDown"/>
    </Item>
    <Item name="AnotherBoolean" type="boolean" readonly="yes" optional="yes"/>
  </Item>
</Item>
</Schema>
```
<Schema url=".../redfish-schema.v1_1_0.json" title="DummySimpleSchema" version="1.2.0">
  <Item name="DummySimple" type="set">
    <Item name="Id" type="string" readonly="yes" optional="no"/>
    <Item name="SampleIntegerProperty" type="number" readonly="no" optional="no"/>
    <Item name="SupportEnabledProperty" type="boolean" readonly="yes" optional="yes"/>
    <Item name="ChildArrayProperty" type="array" arraytype="set">
      <Item name="array element 0">
        <Item name="LinkStatus" type="enum" enumtype="String" readonly="yes" optional="no">
          <Enumeration value="LinkUp"/>
          <Enumeration value="NoLink"/>
          <Enumeration value="LinkDown"/>
        </Item>
        <Item name="AnotherBoolean" type="boolean" readonly="yes" optional="yes"/>
      </Item>
      <Item name="array element 1">
        <Item name="LinkStatus" type="enum" enumtype="String" readonly="yes" optional="no">
          <Enumeration value="LinkUp"/>
          <Enumeration value="NoLink"/>
          <Enumeration value="LinkDown"/>
        </Item>
        <Item name="AnotherBoolean" type="boolean" readonly="yes" optional="yes"/>
      </Item>
      <Item name="array element 2">
        ...
      </Item>
    </Item>
  </Item>
</Schema>
Alphabetized Schema (red = lines moved in sorting)

```
<Schema url=".../redfish-schema.v1_1_0.json" title="DummySimpleSchema" version="1.2.0">
  <Item name="DummySimple" type="set">
    <Item name="ChildArrayProperty" type="array" arraytype="set">
      <Item name="array element 0">
        <Item name="AnotherBoolean" type="boolean" readonly="yes" optional="yes"/>
        <Item name="LinkStatus" type="enum" enumtype="String" readonly="yes" optional="no">
          <Enumeration value="LinkDown"/>
          <Enumeration value="LinkUp"/>
          <Enumeration value="NoLink"/>
        </Item>
      </Item>
      <Item name="array element 1">
        <Item name="AnotherBoolean" type="boolean" readonly="yes" optional="yes"/>
        <Item name="LinkStatus" type="enum" enumtype="String" readonly="yes" optional="no">
          <Enumeration value="LinkDown"/>
          <Enumeration value="LinkUp"/>
          <Enumeration value="NoLink"/>
        </Item>
      </Item>
      <Item name="array element 2">
      ...
      </Item>
    </Item>
    <Item name="Id" type="string" readonly="yes" optional="no"/>
    <Item name="SampleIntegerProperty" type="number" readonly="no" optional="no"/>
    <Item name="SupportEnabledProperty" type="boolean" readonly="yes" optional="yes"/>
  </Item>
</Schema>
```
Sequence Number Annotations (red = added seq nos)

```xml
<Schema url=".../redfish-schema.v1_1_0.json" title="DummySimpleSchema" version="1.2.0">
  <Item name="DummySimple" type="set" seq="0">
    <Item name="ChildArrayProperty" type="array" arraytype="set" seq="0">
      <Item name="array element 0" seq="0">
        <Item name="AnotherBoolean" type="boolean" readonly="yes" optional="yes" seq="0"/>
        <Item name="LinkStatus" type="enum" enumtype="String" readonly="yes" optional="no" seq="1">
          <Enumeration value="LinkDown" seq="0"/>
          <Enumeration value="LinkUp" seq="1"/>
          <Enumeration value="NoLink" seq="2"/>
        </Item>
      </Item>
      <Item name="array element 1" seq="1">
        <Item name="AnotherBoolean" type="boolean" readonly="yes" optional="yes" seq="0"/>
        <Item name="LinkStatus" type="enum" enumtype="String" readonly="yes" optional="no" seq="1">
          <Enumeration value="LinkDown" seq="0"/>
          <Enumeration value="LinkUp" seq="1"/>
          <Enumeration value="NoLink" seq="2"/>
        </Item>
      </Item>
      <Item name="array element 2" seq="2">
        ...
      </Item>
    </Item>
    <Item name="Id" type="string" readonly="yes" optional="no" seq="1"/>
    <Item name="SampleIntegerProperty" type="number" readonly="no" optional="no" seq="2"/>
    <Item name="SupportEnabledProperty" type="boolean" readonly="yes" optional="yes" seq="3"/>
  </Item>
</Schema>
```
String/Sequence Number Lookup Tables

- Extract the strings and their corresponding sequence numbers into tabular form
- Each row has the sequence number, the string, and a pointer to a dependent table (null if none)

<table>
<thead>
<tr>
<th>DummySchema</th>
<th>0: ChildArrayProperty</th>
<th>1: Id</th>
<th>2: SampleIntegerProperty</th>
<th>3: SupportEnabledProperty</th>
</tr>
</thead>
<tbody>
<tr>
<td>ChildArrayProperty</td>
<td>0: AnotherBoolean</td>
<td></td>
<td></td>
<td></td>
</tr>
<tr>
<td>LinkStatus</td>
<td>0: LinkDown</td>
<td>1: LinkUp</td>
<td>2: NoLink</td>
<td></td>
</tr>
</tbody>
</table>

```
Building Schema Dictionaries from Lookup Tables

- Just need data types, output format beyond the data already in the tables

<table>
<thead>
<tr>
<th>Row</th>
<th>Seq</th>
<th>Format</th>
<th>Name</th>
<th>ChildPtr</th>
<th>C DisplayFmt</th>
</tr>
</thead>
<tbody>
<tr>
<td>0</td>
<td>0</td>
<td>set</td>
<td>DummySchema</td>
<td>1</td>
<td>-</td>
</tr>
<tr>
<td>1</td>
<td>0</td>
<td>array</td>
<td>ChildArrayProperty</td>
<td>5</td>
<td>-</td>
</tr>
<tr>
<td>2</td>
<td>1</td>
<td>string</td>
<td>Id</td>
<td>-</td>
<td>%s</td>
</tr>
<tr>
<td>3</td>
<td>2</td>
<td>integer</td>
<td>SampleIntegerProperty</td>
<td>-</td>
<td>%d</td>
</tr>
<tr>
<td>4</td>
<td>3</td>
<td>boolean</td>
<td>SampleEnabledProperty</td>
<td>-</td>
<td>%b</td>
</tr>
<tr>
<td>5</td>
<td>0</td>
<td>boolean</td>
<td>AnotherBoolean</td>
<td>-</td>
<td>%b</td>
</tr>
<tr>
<td>6</td>
<td>1</td>
<td>enum</td>
<td>string</td>
<td>LinkStatus</td>

</tr>
<tr>
<td>7</td>
<td>0</td>
<td>string</td>
<td>LinkDown</td>
<td>-</td>
<td>-</td>
</tr>
<tr>
<td>8</td>
<td>1</td>
<td>string</td>
<td>LinkUp</td>
<td>-</td>
<td>-</td>
</tr>
<tr>
<td>9</td>
<td>2</td>
<td>string</td>
<td>NoLink</td>
<td>-</td>
<td>-</td>
</tr>
</tbody>
</table>
Performing a Simple Read

1. Client sends read command to MC
   b. Part in blue is how the MC decided to expose the device – everything up to the device root
   c. Part in red is controlled by the management topology exported from the device (as the MC decides to offer it)

2. MC identifies the Redfish Resource PDR on the device associated with the device-level portion of the target URI

3. MC uses the PLDM RDEOperationInit command to begin the Operation, specifying the PDRit identified previously

4. Device performs BEJ encoding of resource data

5. Device responds to the RDEOperationInit command signaling success. If the BEJ payload is small enough, the device includes it with the response message; otherwise it gives a transfer handle for the MC to use with MultipartReceive

6. MC uses the RDEOperationComplete command to finalize the Operation. Device frees resources associated with it

7. MC decodes response (using dictionary), to JSON, returns it to the client
Next Up: Encoding Example

- Overview
- Discovery and Registration
  - Schemas and Redfish Resource PDRs
- Operations
- Advanced Topics: Binary Encoded JSON (BEJ)
  - Dictionary Preparation
  - Encoding Example
  - Decoding Example
- Advanced Topics: Tasks
- Advanced Topics: Eventing
Encoding Data: Overview

1. Dump Strings
2. Dump optional data not present
3. Convert to \{SFLV\} tuples
   a. Insert counts for sets and arrays
   b. Use placeholders (for now) for lengths
4. Encode formats, counts, leaf values
5. Fill in lengths working from innermost to outermost
Encoding Example: Raw Data

```xml
<Item name="DummySimple" type="set">
  <Item name="ChildArrayProperty" type="array">
    <Item name="array element 0">
      <Item name="AnotherBoolean" type="boolean" value="true"/>
      <Item name="LinkStatus" type="enum" enumtype="String">
        <Enumeration value="NoLink"/>
      </Item>
    </Item>
    <Item name="array element 1">
      <Item name="AnotherBoolean" optional="yes" NOT PRESENT/>
      <Item name="LinkStatus" type="enum" enumtype="String">
        <Enumeration value="LinkDown"/>
      </Item>
    </Item>
  </Item>
  <Item name="Id" type="string" value="Dummy ID"/>
  <Item name="SampleIntegerProperty" type="number" value="12"/>
  <Item name="SampleEnabledProperty" type="boolean" optional="yes" NOT PRESENT/>
</Item>
```
Encoding Example: Dumping Strings
(Low-order bit of sequence number is a dictionary selector tag; here, always 0)

```xml
<Item type="set" seq="0">
  <Item type="array" seq="0">
    <Item seq="0">
      <Item type="boolean" value="true" seq="0”/>
      <Item type="enum" enumtype="String" seq="2">
        <Enumeration value="(" seq 4")” />
      </Item>
    </Item>
    <Item seq="2">
      <Item optional="yes" NOT PRESENT seq="0”/>
      <Item type="enum" enumtype="String" seq="2">
        <Enumeration value="(" seq 0")” />
      </Item>
    </Item>
  </Item>
  <Item type="string" value="Dummy ID" seq="2”/>
  <Item type="number" value="12" seq="4”/>
  <Item type="boolean" optional="yes" NOT PRESENT seq="6”/>
</Item>
```
Encoding Example: Dumping Non-present Data

```xml
<Item type="set" seq="0">
  <Item type="array" seq="0">
    <Item seq="0">
      <Item type="boolean" value="true" seq="0"/>
      <Item type="enum" enumtype="String" seq="2">
        <Enumeration value="(seq 4)"/>
      </Item>
    </Item>
  </Item>
  <Item seq="2">
    <Item type="enum" enumtype="String" seq="2">
      <Enumeration value="(seq 0)"/>
    </Item>
  </Item>
  <Item type="string" value="Dummy ID" seq="2"/>
  <Item type="number" value="12" seq="4"/>
</Item>
```
Encoding Example: \{SFLV\} Conversions;
Insert Counts for Sets and Arrays

\{0x01 0x00, set, [length placeholder], {  
  {count = 3}  
  {0x01 0x00, array, [length placeholder], {  
    {count = 2}  
    {0x01 0x00, set, [length placeholder], {  
      {count = 2}  
      {0x01 0x00, boolean, [length placeholder], true}  
      {0x01 0x02, enum, [length placeholder], 4}  
    }  
    {0x01 0x02, set, [length placeholder], {  
      {count = 1}  
      {0x01 0x02, enum, [length placeholder], 0}  
    }  
  }  
  {0x01 0x02, string, [length placeholder], “Dummy ID”}  
  {0x01 0x04, integer, [length placeholder], 12}  
}  

www.dmtf.org
Example Encoding: Encoding of Formats, Counts, Leaf Values

```c
{0x01 0x00, 0x00, [length placeholder], {
  0x01 0x03
  {0x01 0x00, 0x01, [length placeholder], {
    0x01 0x02
    {0x01 0x00, 0x00, [length placeholder], {
      0x01 0x02
      {0x01 0x00, 0x07, [length placeholder], 0xFF}
      {0x01 0x02, 0x04, [length placeholder], 0x01 0x04}
    }
    {0x01 0x02, 0x00, [length placeholder], {
      0x01 0x01
      {0x01 0x02, 0x04, [length placeholder], 0x01 0x00}
    }
  }
  {0x01 0x02, 0x05, [length placeholder],
    0x44 0x75 0x6D 0x6D 0x79 0x20 0x49 0x00
    {0x01 0x04, 0x03, [length placeholder], 0x0C}
  }
}
```
Example Encoding: Filling in Lengths at Leaves

```
{0x01 0x00, 0x00, [length placeholder], {
  0x01 0x03
  {0x01 0x00, 0x01, [length placeholder], {
  0x01 0x02
  {0x01 0x00, 0x00, [length placeholder], {
  0x01 0x02
  {0x01 0x00, 0x07, 0x01 0x01, 0xFF}  
  {0x01 0x02, 0x04, 0x01 0x02, 0x01 0x04}
  }
  {0x01 0x02, 0x00, [length placeholder], {
  0x01 0x01
  {0x01 0x02, 0x04, 0x01 0x02, 0x01 0x00}
  }
  }
  {0x01 0x02, 0x05, 0x01 0x09, 0x44 0x75 0x6D 0x6D 0x79 0x20 0x49 0x44 0x00}  
  {0x01 0x04, 0x03, 0x01 0x01, 0x0c}
}
```
Example Encoding: Working Outward to Fill in Lengths

{0x01 0x00, 0x00, [length placeholder], {
    0x01 0x03
    {0x01 0x00, 0x01, [length placeholder], {
        0x01 0x02
        {0x01 0x00, 0x00, 0x01 0x0F, {
            0x01 0x02
            {0x01 0x00, 0x07, 0x01 0x01, 0xFF}
            {0x01 0x02, 0x04, 0x01 0x02, 0x01 0x04}
        }
    }
    {0x01 0x02, 0x00, 0x01 0x09, {
        0x01 0x01
        {0x01 0x02, 0x04, 0x01 0x02, 0x01 0x00}
    }
}
{0x01 0x02, 0x05, 0x01 0x09, 0x44 0x75 0x6D 0x6D 0x79 0x20 0x49 0x44 0x00}
{0x01 0x04, 0x03, 0x01 0x01, 0x0C}
Example Encoding: Outermost Lengths

{0x01 0x00, 0x00, 0x01 0x3F, {

0x01 0x03
    {0x01 0x00, 0x01, 0x01 0x24, {
        0x01 0x02
            {0x01 0x00, 0x00, 0x01 0x0F, {
                0x01 0x02
                    {0x01 0x00, 0x07, 0x01 0x01, 0xFF}
                    {0x01 0x02, 0x04, 0x01 0x02, 0x01 0x04}
            }
            {0x01 0x02, 0x00, 0x01 0x09, 0x44 0x75 0x6D 0x6D 0x79 0x20 0x49 0x44 0x00}
        }
    }
}

{0x01 0x02, 0x00, 0x01 0x09, {

0x01 0x01
    {0x01 0x02, 0x04, 0x01 0x02, 0x01 0x00}
}

{0x01 0x02, 0x05, 0x01 0x09, 0x44 0x75 0x6D 0x6D 0x79 0x20 0x49 0x44 0x00}

{0x01 0x04, 0x03, 0x01 0x01, 0x00C}
Final Encoded Data: 68 bytes

Decoding the Data: Overview

1. Map onto \{SFLV\} tuples, using counts and lengths to identify where the chunks of data lie
2. Throw away counts and lengths
3. Decode format info
4. Decode value info
5. Use sequence numbers to restore strings and enum values
6. Write out as JSON
Decoding Example: Raw Data

0x01 0x00 0x00 0x01 0x3F 0x01 0x03 0x01
0x00 0x01 0x01 0x24 0x01 0x02 0x01 0x00
0x00 0x01 0x0F 0x01 0x02 0x01 0x00 0x07
0x01 0x01 0xFF 0x01 0x02 0x04 0x01 0x02
0x01 0x04 0x01 0x02 0x00 0x01 0x09 0x01
0x01 0x01 0x02 0x04 0x01 0x02 0x01 0x00
0x01 0x02 0x05 0x01 0x09 0x44 0x75 0x6D
0x6D 0x79 0x20 0x49 0x44 0x00 0x01 0x04
0x03 0x01 0x01 0x0C
Decoding Example: Map to \{SFLV\} Tuples with Counts for Sets and Arrays (F=0x01 or 0x02)

```
{0x01 0x00, 0x00, 0x01 0x3F, }
  0x01 0x03
  {0x01 0x00, 0x01, 0x01 0x24, }
   0x01 0x02
    {0x01 0x00, 0x00, 0x01 0x0F, }
     0x01 0x02
      {0x01 0x00, 0x07, 0x01 0x1, 0xFF}
      {0x01 0x02, 0x04, 0x01 0x02, 0x01 0x04}
    {0x01 0x02, 0x00, 0x01 0x09,}
     0x01 0x01
      {0x01 0x02, 0x04, 0x01 0x02, 0x01 0x00}
  }
 {0x01 0x02, 0x05, 0x01 0x09,}
   0x44 0x75 0x6D 0x6D 0x79 0x20 0x49 0x44 0x00
 {0x01 0x04, 0x03, 0x01 0x01, 0x0C}
```
Decoding Example: Throw Away Counts and Lengths

```plaintext
{ 0x01 0x00, 0x00, {
    { 0x01 0x00, 0x01, {
        { 0x01 0x00, 0x00, {
            { 0x01 0x00, 0x07, 0xFF }     
            { 0x01 0x02, 0x04, 0x01 0x04 }  
        }                                   
        { 0x01 0x02, 0x00, {
            { 0x01 0x02, 0x04, 0x01 0x00 }  
        }                                   
    }                                           
    { 0x01 0x02, 0x05,  
        0x44 0x75 0x6D 0x6D 0x79 0x20 0x49 0x44 0x00 }  
    { 0x01 0x04, 0x03, 0x0C }                     
}
```
Decoding Example: Decode Format Info

```plaintext
{0x01 0x00, set, {
    {0x01 0x00, array, {
        {0x01 0x00, set, {
            {0x01 0x00, boolean, 0xFF}
            {0x01 0x02, enum, 0x01 0x04}
        }
        {0x01 0x02, set, {
            {0x01 0x02, boolean, 0xFF}
            {0x01 0x02, enum, 0x01 0x00}
        }
    }
    {0x01 0x02, string, 0x44 0x75 0x6D 0x6D 0x79 0x20 0x49 0x44 0x00}
    {0x01 0x04, integer, 0x0C}
}
```
Decoding Example: Decode Value Info

```
{0x01 0x00, set, {
    {0x01 0x00, array, {
        {0x01 0x00, set, {
            {0x01 0x00, boolean, true}
            {0x01 0x02, enum, <value 2>}
        }
    }
    {0x01 0x02, set, {
        {0x01 0x02, enum, <value 0>}
    }
    }
{0x01 0x02, string, "Dummy ID"}
{0x01 0x04, integer, 12}
```
Decoding Example: Use Sequence Numbers to Restore Strings and Enum Values

```json
{"DummySimple", set, {
  {"ChildArrayProperty", array, {
    <Array Element 0>, set, {
      {"AnotherBoolean", boolean, true}
      {"LinkStatus", enum, "NoLink"}
    }
    <Array Element 1>, set, {
      {"LinkStatus", enum, "LinkDown"}
    }
  }
  {"Id", string, "Dummy ID"}
  {"SampleIntegerProperty", integer, 12}
}
```
Decoding Example: Write Out JSON

```json
{
    "DummySimple" : {
        "ChildArrayProperty" : [
            {
                "AnotherBoolean" : true,
                "LinkStatus" : "NoLink"
            },
            {
                "LinkStatus" : "LinkDown"
            }
        ],
        "Id" : "Dummy ID",
        "SampleIntegerProperty" : 12
    }
}
```
Next Up: Tasks

  - Schemas and Redfish Resource PDRs
- Operations
- Advanced Topics: Binary Encoded JSON (BEJ)
  - Dictionary Preparation
  - Encoding Example
  - Decoding Example
- Advanced Topics: Tasks
- Advanced Topics: Eventing
Tasks

- When an Operation cannot complete quickly, the device spawns a Task to run it asynchronously.
- Running async status reflected in initial return to the MC.
- MC creates Task and TaskMonitor objects in the appropriate collections.
  - ResourceID names the resource the Task is operating on.
  - OperationID names the specific Operation.
  - Combination of these can form part of the external URI exposed to the client for Task management.
- Client read of the TaskMonitor cause the MC to issue the RDEOperationStatus command to get current info from the device.
- Client delete of the Task collection member or TaskMonitor causes MC to issue RDEOperationKill to abort the Operation.
- MC removes both Task collection member and the TaskMonitor when the client successfully reads TaskMonitor.
Next Up: Eventing

- Overview
- Discovery and Registration
  - Schemas and Redfish Resource PDRs
- Operations
- Advanced Topics: Binary Encoded JSON (BEJ)
  - Dictionary Preparation
  - Encoding Example
  - Decoding Example
- Advanced Topics: Tasks
- Advanced Topics: Eventing
Eventing

- **Two forms of Events in RDE**
  - Task completion Events: asynchronous completion of an long-running Task
  - Redfish Events: various occurrences, based on the message registry
  - New PLDM eventClass defined for each type

- **Two models for getting Events from device to MC**
  - If device, channel, and MC all support asynchronous notifications
    - Device pushes Event with PLDM M&C PlatformEventMessage command
    - MC response acknowledges Event and allows device to free Event resources
  - Otherwise (such as SMBus)
    - MC polls in a loop via PLDM M&C PollForPlatformEventMessage command
    - Each loop iteration acknowledges the previous Event
Thank you!
