Cloud Monitoring and Auditing with CADF
(Cloud Auditing and Data Federation)

Jacques Durand (Fujitsu)
Matt Rutkowski (IBM)
The DMTF was formed to lead the development, adoption and unification of management standards and initiatives for desktop, enterprise and internet environments.

The information in this presentation represents a snapshot of work in progress within the DMTF.

This information is subject to change. The Standard Specifications remain the normative reference for all information.

For additional information, see the Distributed Management Task Force (DMTF) Web site.
Agenda

- Motivation
- Standard Overview
- Data Model – Events, Logs
- Taxonomies Overview
- Interfaces and Querying
- Challenges
Cloud Monitoring / Auditing

- Need for more Visibility of Cloud Operations
  - Consumers: Control of Operating Expenses
    - Understanding Cloud consumption patterns.
    - Per-Tenant Event Logs
  - Virtualized resources, Multi-tenant
    - Need to understand how workloads affect each other
    - Predictability of performances, or consumption

- Contractual Nature of Cloud Operations
  - Cloud Providers have obligations to various Entities
    - Regulatory / Government
    - Company (Policies)
    - Customer SLA, SLO
    - Brokers
General Scenario: Managing Auditing Data on (Hybrid) Clouds

- Similar Reports from different Clouds
- Aggregate Audit Data from Different Clouds / Partners
- Auditing Processes & Tools Unchanged

Why an Audit Standard?
Why an Audit Standard?

Use Cases:

- Client-side **Auditing Tools** accessing any Cloud Provider
- Customers **Changing** Cloud Providers, want a consistent way to track compliance
- Aggregating Audits from **Hybrid Clouds**
Distinction between “Monitoring” material and “Audit” material is blurred

- The Objectives are as diverse as
  - Tracking and Enforcing all aspects of Security
  - Ensuring Service Levels
  - Enforcing Best Practices and Policies

- All Operations may be subject to Audit
  - Cloud Auditing involves real-time events beyond traditional security concerns and reflect on all kinds of operations,
    - resource lifecycle, data migrations, performance
Comprehensive Monitoring Model needed for Auditing

- Basic construct: **Events**
- Very Diverse Events are fair game for Auditing
  - Remote user access and requests
  - Virtual resources allocation and **lifecycle** management
  - Regular monitoring of **workloads**
  - **Usage** metering
  - System **alerts**
  - **Notifications** to users

<td>Representation of SLM monitoring events, their metrics and rule representations</td>
</tr>
<tr>
<td>Signature</td>
<td>The need to sign audit information at various granularities (e.g. event, report and log level)</td>
</tr>
<tr>
<td>Summarizing</td>
<td>representation of repeated events that are collapsed into a single event for reporting (for compactness)</td>
</tr>
<tr>
<td>Temporal</td>
<td>Attributing event actions with time-based information (e.g. granularity of measurement observed time, best time, modification time, etc.)</td>
</tr>
</tbody>
</table>
A Generic **Model** for Events and Logs

- A comprehensive Event, Log and Report model, that serves both operational and auditing objectives.

**Interfaces**

- Protocol & Service Methods to Manage and Federate Events, Logs and Reports

**Taxonomies**

- Normalize the Classification of Audit Events, (resources, operations, outcomes).
Distinction between:

- Actual (physical) Event
- Event Record (a representation, ~ CIM Indication)
- CADF Event Record (CADF-compliant Event Record)

Not a 1-1 relationship between

- Actual Evt ↔ Event Record
- Different aspects of same physical event
- Aggregation / summarization of many actual evts
Yet Another Event Standard?

- Previous Efforts:
  - CEE (MITRE),
  - XDAS (X/Open Distributed Audit Service)
  - ...

- Under DMTF:
  - CIM Indications,
  - CIMI Events

> Inputs from existing event models and use cases analysis → versatile event model.
CADF Standard Overview

Events (3)

Observer
(a Reporter)

Observes

Initiator

Action

Target

Actual Event

Described using CADF Event Component Semantics
Three major event classes have been identified:

- (a) **activity** (tracking operations),
- (b) **monitoring** (resource status),
- (c) **control** (policy-based decisions).
## CADF Standard Overview

### Events (5)

<table>
<thead>
<tr>

<tr>
<td>Policy enforcement point</td>
<td>control</td>
<td>Policy enforcement point</td>
<td>deny</td>
<td>User request (e.g., access to a server)</td>
<td>(success, failure, pending.)</td>
<td>REASON (rationale for control action)</td>
</tr>
</tbody>
</table>
The genesis of an event record may involve several entities or "reporters" starting from the initial "observer".
Three extensions mechanisms:

1. Attachments
   - allows attachments of any kind to both events and logs

2. Derivation (OO-style sub-typing)
   - E.g., attributes specific to some Resource types

3. Tags
   - For categorizing / labeling events

CADF Standard Overview
Extensibility
<event>
  id="myscheme://mydomain/event/id/1234"
  eventType="activity"
  eventTime="2012-03-22T13:00:00-04:00"
  action="create"
  outcome="dmtf:cadf:0262:0100:success">
    <initiator typeURI="resource/security/account/user">
      <user id="provider-domain:user1234" />
    </initiator>
  </target typeURI="resource/service/database">
    <account type="subscriber" id="CIM:account-id">
      // Optionally embed provider specific account data here
    </account>
  </target>
  <reportchain>
    <reporterstep role="observer" id="provider-domain:observer-id"/>
    <reporterstep role="modifier" id="provider-domain:modifier-id"/>
  </reportchain>
  <tag>provider-domain:grouping:PCI?value=a123</tag>
  <tag>//myobserver/correlationID?value=1234</tag>
</event>
LOG: more than just a collection of Events: an Event Container
- must support merging, transfer, event selection,

Has additional, contextual Information typically shared by many Events:
- Description/State of Cloud resources involved,
- User data,
- geolocations
- metrics

Extensibility: attachments
CADF Standard Overview
Logs (2)

Log
- Resource
- Geolocation
- Metric

Shared resources

Events

References to Shared resources
A Generic Model for Events and Logs

- A comprehensive Event, Log and Report model, that serves both operational and auditing objectives.

Interfaces

- Protocol & Service Methods to Manage and Federate Events, Logs and Reports

Taxonomies

- Normalize the Classification of Audit Events, (resources, operations, outcomes).
Taxonomies allow for categorizing events in a consistent way.

Taxonomies have been defined for
- event actions,
- resources
- outcomes.

An additional tagging mechanism adds flexibility by allowing cross-categorization of events.
**Goal**: Normalize the Classification of Audit Events Using CADF Defined Taxonomies

- A Logical Meta-Model for Naming Cloud Resources involved
- Resources Compatible with other Formal Objective Inheritance models (like CIM)

Semantic overlap is OK

Different **perspectives** on same Resource  Different taxonomy **Paths**.
Sample Expansion of the **Compute** Subtree

- **Categorization**
- **Instance (is-a)**

Diagram:
- **Compute**
  - **node**
  - **cpu**
  - **machine**
  - **process**
  - **thread**
  - **vpu**
  - **vm**
Sample Expansion of the Storage Subtree

Taxonomy Paths vs unique names:

e.g. resource/storage/database
Taxonomies: Service Subcategory Examples

Sample Expansion of the Service Subtree
Sample Expansion of the Service Subtree

- **OSS**
  - capacity
  - configuration
  - monitoring
  - performance
  - provisioning
  - virtualization

- **BSS**
  - billing
  - metering
  - location
  - crm
  - erp
  - srm
Sample Expansion of the **Security Subtree**
Top-level Action taxonomy

- create
- read
- update
- delete
- monitor
- start
- stop
- deploy
- undeploy
- enable
- disable
- send
- receive
- authenticate
- revoke
- renew
- logon
A Generic Model for Events and Logs

- A comprehensive Event, Log and Report model, that serves both operational and auditing objectives.

Interfaces

- Protocol & Service Methods to Manage and Federate Events, Logs and Reports

Taxonomies

- Normalize the Classification of Audit Events, (resources, operations, outcomes).
A REST interface for accessing event logs, reports

- URIs for top-level resources (logs, reports)
- XML or JSON serialization
- Once complete, logs are not supposed to be modified (→ GET, not PUT or PATCH)
  - Processing logs (signing, consolidating) → new Log

Events to be accessed via querying/selection in a log.

- GET <log-URI> “?” <query>
Event Querying and Filtering (1)

- Query parameter $filter appended to the URI of queried resource

- Query all Events in a Log, that report on a Resource creation

\[ /events/Event?$filter=\text{action}="\text{create}" \]

- Query all Events in a Log, that have a target Resource located in Denver

\[ /events/Event?$filter=target/\text{geolocation}/\text{city}="\text{Denver}" \]
Event Querying and Filtering (2)

- Query all Events in a Log, that report on a **failed** Resource creation

/even\ts/Event?$filter=((action='create')\sand\n(outcome='failure'))

- Query all Events in a Log, that **occurred on or after** 2013-07-22

/even\ts/Event?$filter=\neventTime\geq"2013-07-22T00:00:00-02:00"
TAXONOMY queries

Query all Events in a Log, with a target resource of type equal to “resource/service/oss/virtualization”.

```
/events/Event?
$filter=target/typeURI="resource/service/oss/virtualization"
```

Query all Events in a Log, that have a target Resource of type equal or under “resource/service/oss"

```
/events/Event?
$filter=target/typeURI="resource/service/oss/*"
```
Event Querying and Filtering (4)

- **TAXONOMY queries**

- Query all Events in a Log, with a target resource of type ending with “security/profile”.

  /events/Event?$filter=
target/typeURI="resource//security/profile"

- Query all Events in a Log, that have at least one of their tags of value “//GRC20.gov/cloud/security/pci-dss”

  /events/Event?$filter=
tags[*]="//GRC20.gov/cloud/security/pci-dss"
Event Querying and Filtering (5)

- **Other query parameters**
  - Limiting returned results
    - `/events/Event?$limit=100`
    - `/events/Event?$offset=800`

- **Pagination**
  - `/events/Event?$first`
  - `/events/Event?$last`
  - `/events/Event?$previous`
Particularly Useful “CADF” Data Types

- **Identifier**
  - A kind of URI – for all kinds of CADF Resources
  - "scheme": hier-part [ "?" query ] [ "#" fragment ]

- **Path**
  - A kind of URI, used for taxonomies
  - "cadf://schemas.dmtf.org/cloud/audit/1.0/resource/storage/database"

- **Tag**
  - A kind of URI
  - “//GRC20.gov/cloud/auditplan?value=audit101”

- **Timestamp**
  - A profile of UTC time: “2012-02-25T09:00:00-05:00”
  - based upon the xs:dateTime as per XMLSchema2

- **Attachment**
  - A container type for any extended content
Challenges: Event Correlations (1)

- Request-Responses (sync, async)
- Causality (action+reaction)
- Split: a single Actual Event on Multiple Resources
  - Multiple event records
- A single User request crossing several system layers
  - (gateway, authorization, resource manager…)
  - System components may not act as ‘reporters” on the same event – Instead, generate their own event record.
Challenges: Event Correlations (2)

- Use of correlation tags
  - E.g. deletion of all files in a subdirectory
  - (A Single Actual Event on Multiple Resources → Multiple events)

```xml
<Event id="myscheme://mydomain/id/1234" action="delete" >
  ...
  <target id="myscheme://mydomain/resource/id/0001" name="file01.txt" typeURI="data/file"></target>
  <tags>
    <tag>//myobserver/correlationID?value=1234</tag>
  </tags>
</Event>

<Event id="myscheme://mydomain/id/1235" action="delete" >
  ...
  <target id="myscheme://mydomain/resource/id/0002" name="file02.txt" typeURI="data/file"></target>
  <tags>
    <tag>//myobserver/correlationID?value=1234</tag>
  </tags>
</Event>
```
Use of explicit Event reference lists, in attachments

- E.g. summarizing event, inability to tag

```
<Event id="myscheme://mydomain/id/1234">
...
<attachments>
  <attachment name="correlatedEvents">
    <content><events>
      <Eventref eventId="myscheme://mydomain/event/id/AAA" />
      <Eventref eventId="myscheme://mydomain/event/id/BBB" />
    </events>
  </content>
</attachment>
</attachments>
</Event>
```
Cloud Monitoring and Auditing with CADF
