Redfish

Introduction

• Proposal to extend Redfish DCIM models to incorporate cooling units

- Support for rack-based Cooling Distribution Units (CDUs)
- Support for immersion cooling units
- Models should apply generally to other liquid cooling gear
 - Rear-door heat exchangers, air conditioners, etc.
- Expect the model to also cover air-cooling systems
 - Explicit coverage is not shown in this proposal, but some notes are mentioned
- Intend to model all equipment types covered by OCP requirements
- Leverages existing Redfish DCIM models and style
 - Adapts the Power Distribution Unit concepts, schemas and properties
 - Controls several instances of valves for liquid flow
 - Sensors New types for pressure, flow rates, etc.
 - Additional "discrete" sensor definitions

Expected Release Timeline

- Work-in-Progress release v0.9
 - Incorporated feedback from alliance partner organizations and others
- Intend to release v1.0 of this work by end of 2022
 - CoolingEquipment, CoolingUnit, CoolingLoop schemas
 - Subsystem schemas: Pump, Reservoir, Filter
 - DiscreteSensor schema
 - PowerEvent and ThermalEvent message registries
- Support in v1.0 expected for:
 - Rack-based or free-standing CDU's
 - Immersion cooling systems
 - Liquid-cooled (self-contained) servers
 - Rear-door heat exchangers
- Expect further additions in the Redfish 2023.1 and future releases

THERMAL EQUIPMENT MODEL

www.dmtf.org

6

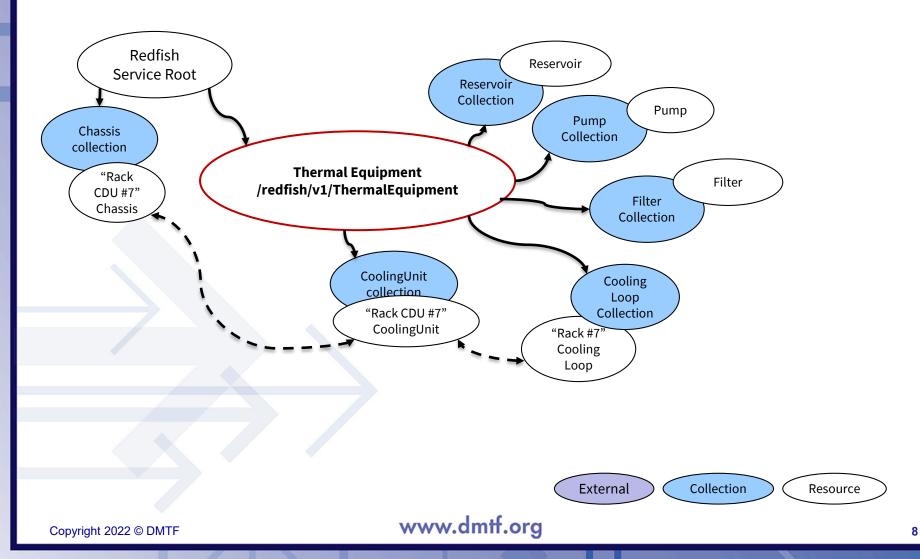

NEW ThermalEquipment resource

Single resource under ServiceRoot

- Follows design pattern used for **PowerEquipment**
- Contains links to all cooling systems and related equipment
- Used primarily for discovery of managed equipment
- Links to Resource Collections of:
 - Cooling Distribution Units (CDU's)
 - Immersion cooling units
 - Air Handler (CRAH) units
 - Air Conditioners (CRAC) units
 - Cooling Loops
 - Both facility-level (FWS) and rack/secondary (TCS) loops
 - Free standing Pumps, Filters, and Reservoirs
 - Equipment not included within a CDU
 - Other cooling equipment?

Thermal Equipment Model

COOLING LOOP MODEL

Copyright 2022 © DMTF

www.dmtf.org

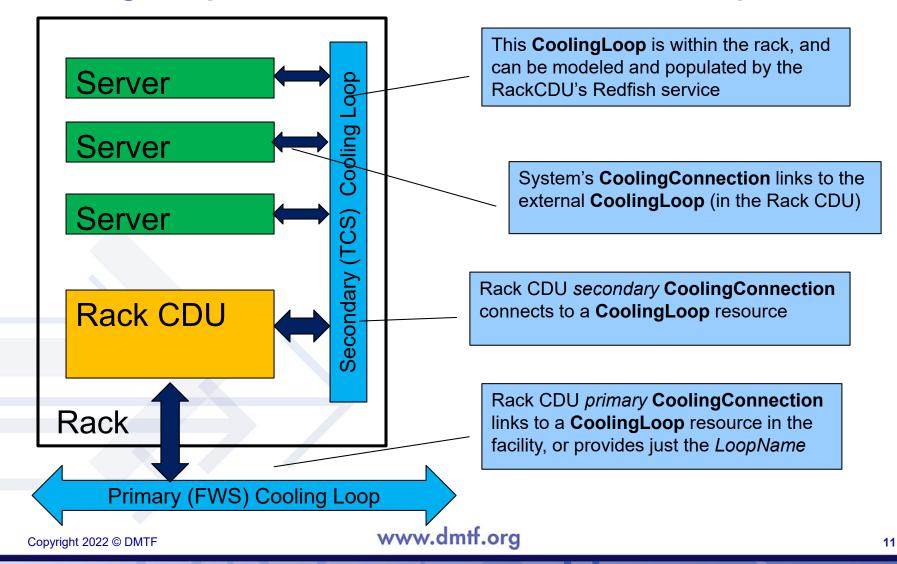

9

Cooling Loop Model

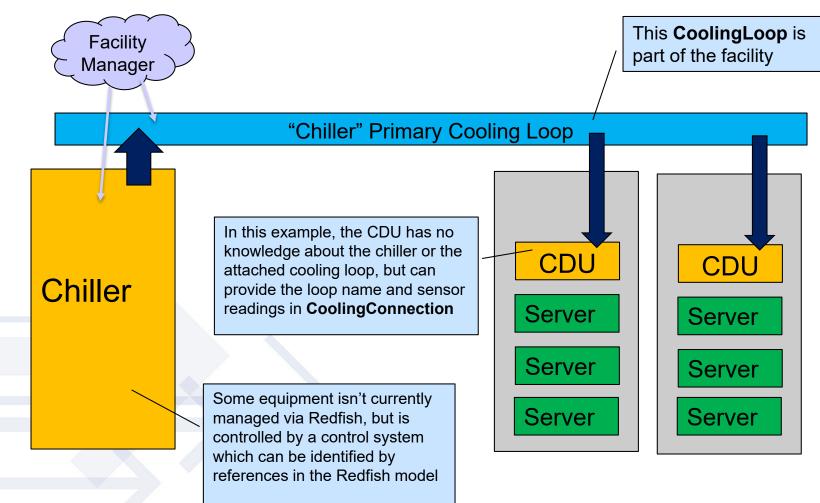

CoolingLoop model

- Describes the physical characteristics and capacities of a cooling loop
- Loop can be self-contained (within a rack or group of racks)
 - Or can be facility-wide (primary loops from external chillers, etc.)
- Shows connectivity to equipment
 - Provides means for both "names" (strings) and links to resources
- CoolingConnection models connections to a CoolingLoop
 - Models the "supply" and "return" side of the managed equipment
 - An instance is either a connection pair, or an individual supply or return
 - Metrics are gathered at these connection points
 - Allows independent metrics for each piece of equipment connected to the loop
 - Provide information about the connected loop if available
 - User-entered "loop name" provides a connection path through the infrastructure

Cooling Loop – Rack-level self-contained example

Cooling Loop – facility level example

NEW CoolingLoop schema

- CoolingLoopCollection placed under ThermalEquipment
- Reports product, location, and capacity for the loop
 - CoolingLoopType Condenser, Facility, Technology, Immersion, Internal
- Describes the coolant properties
 - FluidType Water, GlycolMixture, Dielectric
 - *FluidQuality* Normal or Abnormal
 - FluidLevelStatus OK, Warning, Critical
- Methods to represent connections to related equipment
 - ConsumingEquipmentNames[] User-defined string for unmanaged gear
 - ConsumingEquipment[] R/W array of links to Chassis resources
 - CoolingManagerUri User-defined link to a management console

NEW CoolingLoop resource

```

COOLING UNIT MODEL

Copyright 2022 © DMTF

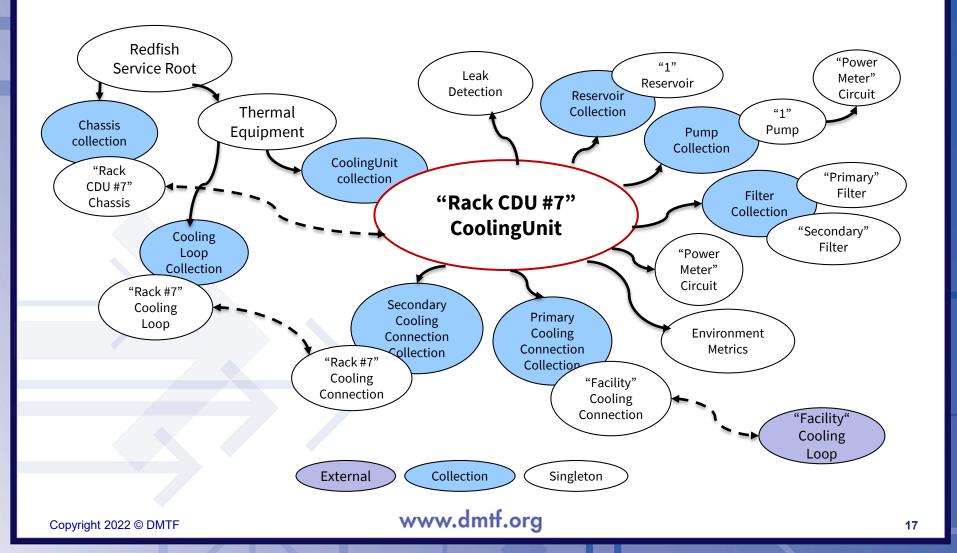

www.dmtf.org

15

NEW CoolingUnit schema and resources

- Unified schema covers many types of cooling gear
 - Equipment that cannot be modeled by a **Chassis** and **ThermalSubsystem**
 - Heat exchangers and manifolds expected to be covered as a Chassis
 - CoolingUnit equipment will have a containing Chassis resource
 - Share common modeling and property definitions
 - EquipmentType property provides specific identification
- Resource contents
 - General product identification model, manufacturer, serial number, etc.
 - Versioning Hardware revision, firmware version, date of manufacture
- Links to subordinate and related resources
 - Sensors, DiscreteSensors, Metrics (entire unit)
 - Primary (input) and Secondary (output) CoolingConnections
 - Subsystems: Pumps, Filters, Reservoirs
 - Chassis that contains the equipment

Cooling Unit Model

NEW CoolingUnit schema

```
"@odata.type": "#CoolingUnit.v1_0_0.CoolingUnit",
"Id": "1".
"EquipmentType": "CDU",
"Name": "Rack #4 Cooling Distribution Unit",
"FirmwareVersion": "3.2.0",
"Version": "1.03b",
"ProductionDate": "2020-12-24T08:00:00Z",
"Manufacturer": "Contoso".
"Model": "BRRR4000",

"Sensors": { "@odata.id": < Link to SensorCollection > },
"Controls": { "@odata.id": < Link to ControlCollection > },
< TRUNCATED >
```

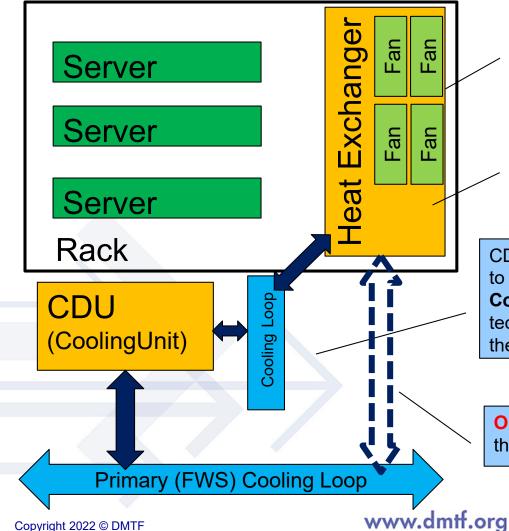

NEW CoolingConnection schema

- The connection between the cooling unit and a CoolingLoop resource
 - Modeled either a connection pair, or an individual "supply" or "return"
 - Provides numerous sensor readings and controls
 - Flow, Temperature, Pressure on both supply and return
 - Valve controls
 - If known, provide link to CoolingLoop
 - Or the loop name and Manager URI if known and populated by end user
- Main monitoring resource for the cooling unit's functionality
 - Primary cooling connections input from facility chillers or other sources
 - Secondary cooling connections
 output from the cooling unit to feed "consuming" equipment

NEW CoolingConnection schema

```
"@odata.type": "#CoolingConnection.v1_0_0.CoolingConnection",
 "Id": "Chiller".
 "Name": "Primary Input from Chiller",
                                                   As CoolingConnectionType is really a
 "Status": {
                                                   description of the loop – this may become a
     "Health": "OK"
 },
                                                   more general descriptor to indicate if this
 "CoolingConnectionType": "Primary",

```

Example: Rear Door Heat Exchanger – CDU and Chassis

The heat exchanger is modeled as a **Chassis** with a **ThermalSubsystem** that describes the **Fans**

ThermalSubsystem may need additional sensors to describe airflow (TBD)

CDU *primary* **CoolingConnection** attaches to the facility cooling loop and its *secondary* **CoolingConnection** connects to a technology loop, which in turn connects to the heat exchanger via **CoolingConnection**

OR the heat exchanger directly connects to the facility loop via a **CoolingConnection**

Cooling Loops / Cooling Connections – open questions

- Support for Air / Phase Change / Liquid loops
 - Phase change (refrigerant) loops can be modeled with this pattern as well
 - Not recommended for initial release, wait for industry feedback
 - LoopType = Air, Liquid, Primary / Secondary?
 - How best to differentiate primary / secondary connections
 - Currently in separate collections (and focused on liquid coolant)
 - Added CoolingLoopType to CoolingConnection to show "where the connection goes"
 - An "air loop" could be the room, plenum, or ductwork
 - Air handling may not be 'contained', but the "loop interface" may still apply
- Chassis links and physical containment
 - Need to validate that model supports adequate and consistent links for physical containment of cooling units and cooling loops
 - Support any mix of managed / unmanaged gear while minimizing the types of links and resources

NEW PowerMeter resource

- Immersion cooling units have additional power-related requirements
 - Ability to report the power consumption of all "immersed" equipment
 - Ability to control the power state of all immersed equipment
 - Both from a breaker (over current) and user-actuated control perspective
- Leverage existing **Circuit** schema for this purpose
 - Add new *CircuitType* of "PowerMeter"
 - Allows a Circuit resource to appear under CoolingUnit
 - Enables use of *PowerControl* and *BreakerControl* actions
- Power consumption and other monitoring of the cooling equipment itself is shown in EnvironmentMetrics or PowerSubsystem under the Chassis related to the CoolingUnit
 - Would like to reduce the number of choices here for interoperability
 - Use of EnvironmentMetrics on the Chassis may be a consistent answer

Circuit schema as PowerMeter example

```
"@odata.type": "#Circuit.v1_6_0.Circuit",
"Id": "PowerMeter".
"Name": "Pump #1 Power Meter",
"Status": { < Status object> },
"CircuitType": "PowerMeter",
"PhaseWiringType": "TwoPhase3Wire",
"NominalVoltage": "AC240V",
"RatedCurrentAmps": 16,
"BreakerState": "Normal",
"PowerState": "On",
"VoltageSensor": { < Single-phase voltage sensor > },
"PolyPhaseVoltageSensors": { < Voltage per phase sensors > },
"CurrentSensor": { < Total Current sensor > },
"PolyPhaseCurrentSensors": { < Current per phase sensors > },
"PowerSensor": { < Total Power sensor > },
"PolyPhasePowerSensors": { < Power per phase sensors > },
"FrequencySensor": { < Frequency sensor > },
"EnergySensor": { < Energy sensor > },
"Actions": { < ResetBreaker, ResetStatistics > }
"@odata.id": "/redfish/v1/CoolingEquipment/RackCDUs/1/Pumps/1/PowerMonitor",
```

£

}

NEW Subsystems for CoolingUnit and ThermalEquipment

- Equipment that may appear as a subsystem or component of a CoolingUnit, or may be a free-standing device
 - Model allows for this equipment to reside under ThermalEquipment, or as subordinate resources to an individual CoolingUnit
- For release v0.9, these schema contain only basic inventory and identification data
 - Expect to add more specific properties as feedback is received
 - But even the basic part and product information is useful to customers
- Pump Resource Collection
 - Will have differential pressure / absolute pressure, flow, etc.
 - Variable Frequency Drive may need an object
 - *PowerMeter* (Circuit) subordinate resource
 - May be 3-phase, have a breaker, etc.

NEW Subsystem schemas, continued

Reservoir Resource Collection

- Fill level, pressure sensors
- Air bleed value (controls), fill valve, drain valve
- May have connections between reservoirs (balancing)

• Filter Resource Collection

- Pressure sensors
- Service time / install time, life etc.
- ASHRAE requirements / classifications
- Flush / clean actions?

DISCRETE SENSORS AND LEAK DETECTION

NEW LeakDetection schema

- Resource to describe leak detection equipment and report leaks
 - Allows discovery of detection equipment to validate customer requirements
- LeakDetectorGroups supports multiple "zones" of detection
 - Each group represents a detection zone
 - Made up of one or more *LeakDetection* sensors
 - Can also include a humidity sensor
 - "Policy" for what constitutes a reported leak is left to implementation
 - Assumes this is manufacturer or configuration based, not user-defined
- Status object provides means to report leaks
 - Will define messages for reporting leaks as *Conditions*

LeakDetection example

```
"@odata.type": "#LeakDetection.v1_0_0.LeakDetection",
  "Name": "Leak Detection Systems",
                                                In this example with one
  "Status": {
                                                LeakDetectorGroup, there are three
      "State": "Enabled",
                                                sensors, with the implementation deciding
      "Health": "OK",
                                                the policy under which a leak is reported
      "Conditions": []
  },
  "LeakDetectorGroups": [{
      "GroupName": "Detectors under and around the CDU",
      "HumidityPercent": {
                                        Humidity reading, with an internal
          "Reading": 45
                                        threshold to indicate a leak
      },
      "DiscreteDetectors": [{
              "DataSourceURI": "/redfish/v1/ThermalEquipment/CDUs/1/DiscreteSensors/LeakDetection",
              "DeviceName": "Moisture-type Leak Detector",
              "DiscreteState": "OK"
                                                        Two types of DiscreteSensor, which will
          },
                                                        indicate a leak with a DiscreteState of "Alert"
              "DataSourceURI": "/redfish/v1/ThermalEquipment/CDUs/1/DiscreteSensors/Overflow",
              "DeviceName": "Overflow Float Switch",
              "DiscreteState": "OK"
  }],
                                         www.dmtf.org
Copyright 2022 © DMTF
                                                                                                     29
```

NEW Discrete Sensor model

- Leak detection devices tend to be discrete / state-based devices
- There are other cases for sensors which are just "dry contact" inputs
 - Many of these should be modeled as properties with enumerations
 - e.g. "DoorState": "Open" / "Closed"/ "Locked" is the preferred definition compared to "DoorOpen" boolean
 - But many trigger events on state changes, have product information, and other metadata to include in the model
- Propose leveraging the **Sensor** model to create **DiscreteSensor**
 - DiscreteState is the primary property
 - Supports an enumerated list of possible states
 - "OK", "Alert" are the first proposed states.
 - "Disconnected" may be added to show sensor wire has been disconnected
 - SupportedDiscreteStates provides the list of supported states
 - DiscreteThresholds provides reactions to DiscreteStates values

DiscreteSensor schema as Leak Detector example

```
"@odata.type": "#DiscreteSensor.v1_0_0.DiscreteSensor",
   "Id": "LeakDetector".
   "Name": "Moisture-type Leak Detector",
   "DiscreteSensorType": "Moisture",
   "Status": {
       "State": "Enabled",
                                                   DiscreteState is analogous to Reading in a
       "Health": "OK"
                                                   Sensor. SupportedStates shows what
   },
                                                   states may be reported by this sensor
   "DiscreteState": "OK".
   "SupportedStates": [ "OK", "Alert" ],
   "PartNumber": "3493-A44",
   "Manufacturer": "Contoso Water Detection Systems",
   "Location": {
       "PartLocation": {
            "Reference": "Bottom",
            "ServiceLabel": "Leak Detector"
                                                 DiscreteThresholds shows the mapping of
   },
                                                 state values to reported Status or
   "DiscreteThresholds": {
                                                 Conditions.

QUESTIONS FOR INDUSTRY

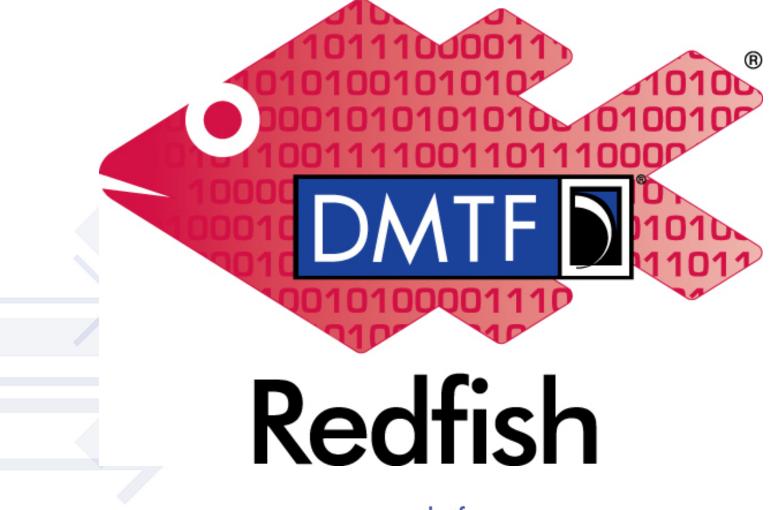

Copyright 2022 © DMTF

Status and open topics

- Model is solidifying with several name changes since last release
 - Expect more property additions prior to v1.0, depending on feedback
- Expect support for air-liquid cooling units
 - Reviewing model to ensure this support can be added
 - Likely finalized after the v1.0 release of this material (add to next release)
- Significant number of common messages to define for Events / Alarms
 - Expect to define new message registries
 - Should be able to harvest existing SNMP trap definitions as a starting point
 - Will be prioritizing this portion of the effort to enable products to be fully managed using Redfish (and without requiring SNMP "in practice")
