1. Introduction

This document presents an LDAPv3 [1,2] schema for the DMTF CIM Core 2.3 Model [3]. Associations are mapped using a combination of auxiliary classes and DIT structure rules. The content and structure rules provided here are suggestions and may be modified as needed to support a particular directory structure. Directory administrators do not need to subclass/instantiate all of the classes in this schema. They are free to choose the subset that meets their particular needs. In the mapping of properties to attributes, syntax object identifiers have been replaced by textual names. The correspondence between names and OIDs is:

<table>
<thead>
<tr>
<th>textual name</th>
<th>OID</th>
</tr>
</thead>
<tbody>
<tr>
<td>boolean</td>
<td>1.3.6.1.4.1.1466.115.121.1.7</td>
</tr>
<tr>
<td>DN</td>
<td>1.3.6.1.4.1.1466.115.121.1.12</td>
</tr>
<tr>
<td>DirectoryString</td>
<td>1.3.6.1.4.1.1466.115.121.1.15</td>
</tr>
<tr>
<td>generalizedTime</td>
<td>1.3.6.1.4.1.1466.115.121.1.24</td>
</tr>
<tr>
<td>integer</td>
<td>1.3.6.1.4.1.1466.115.121.1.27</td>
</tr>
</tbody>
</table>

2. LDAP Mapping Considerations

2.1 Differences from the Core CIM Model

This mapping differs from the core CIM model in that the hierarchy of classes beginning with CIM_StatisticalInformation or CIM_Statistics have not been mapped, nor has the CIM_DependencyContext association been mapped.

This mapping uses DIT containment to map weak CIM associations. LDAP allows structural rules only for structural classes. The CIM associations HostedService, HostedAccessPoint, and SystemDevice are weak associations between abstract classes so while these associations are not mapped, the DIT containment rules will be instantiated for structural subclasses of these abstract classes.

<table>
<thead>

<td>cim23System</td>
<td>cim23ServiceAccessPoint</td>
</tr>
<tr>
<td>SystemDevice</td>
<td>cim23System</td>
<td>cim23LogicalDevice</td>
</tr>
</tbody>
</table>

2.2 Inheritance Assumptions

2.2.1 General

This schema mapping is based on the assumption that name form rules structural rules, and content rules are inherited by both auxiliary and structural sub-classes. For implementations where this is not the case, extra rules will need to be specified.
On the other hand, the attributes contained in auxiliary classes in this mapping are based on the assumption that inheritance does not occur between auxiliary classes (even though such inheritance is shown in the auxiliary class definitions). For implementations that do support this type of inheritance, the schema definitions will be simpler.

2.2.2 Object Classes

For simplicity, updated object classes will inherit only a single parent. While the LDAP standards do not preclude specifying multiple inheritance for object classes, it is doubtful that such a specification would find use in general implementations.

2.3 Helper Classes

2.3.1 cimAssociationInstance

This object class is used as an alternative attachment point for association auxiliary class information. Each association instance of an object is represented by an instance of cimAssociationInstance immediately subordinate to the object's entry. The association auxiliary class is then attached to the cimAssociationInstance entry. Therefore, cimAssociationInstance may have an CIM association auxiliary class attached to it. This alternative is required, for example, when an object engages in multiple instances of a particular type of association, in which case it would not be possible to attach multiple auxiliary classes of the same type to the object's entry. For simplicity, symmetric mapping is assumed. This leads to two possibilities: the auxiliary classes for an instance of a particular CIM association class are attached to the structural class on both sides of the association as shown in Figure 1, or they are attached to cimAssociationInstance objects on both sides of the association as shown in Figure 2.

Because these classes are subordinates, they use cimAssociationName as their RDN. So that directory implementers may use their own unique names in cimAssociationName, cimAssociationTypeName is also defined that may store extra information. This information is intended to hold the CIM Association Type (e.g. "CIM_VLANFor") to aid when searching.
CIM defines the concept of an ordered array, which LDAP does not support. In the core CIM model, indexed arrays are only used in two abstract classes (CIM_ComputerSystem and CIM_LogicalDevice) to tie the values of two property arrays together. In the LDAP mapping, these properties are replaced with separate instances of cimOtherIdentifyingInfoInstance that each contain a single pair of attribute values and are DIT contained by the parent class. The attribute cimOtherIdentifyingInfo is already defined below and reused here and the attribute arrayIndex is defined as the RDN for this...
Finally, the structure rule is provided as a template to be filled in with structure rule pointers to structural rules defined for sub-classes of cim23ComputerSystem and cim23LogicalDevice.

```
( 1.3.6.1.4.1.412.100.1.2.5 NAME 'arrayIndex'
  DESC 'the index of this child'
  SYNTAX DirectoryString
  EQUALITY caseIgnoreMatch
)

( 1.3.6.1.4.1.412.100.2.2.23 NAME 'cimIdentifyingDescription'
  DESC 'A free-form string providing explanation and
details behind the entries in the OtherIdentifyingInfo
attribute.'
  SYNTAX DirectoryString
)

( 1.3.6.1.4.1.412.100.2.1.1.43
  NAME 'cimOtherIdentifyingInfoInstance'
  DESC 'helper class to tie indexed arrays in core model together'
  SUP top
  MUST ( arrayIndex )
  MAY ( cimOtherIdentifyingInfo $ cimIdentifyingDescription )
)

( 1.3.6.1.4.1.412.100.2.3.1.5
  NAME 'cimOtherIdentifyingInfoInstanceNameForm'
  OC cimOtherIdentifyingInfoInstance
  MUST ( arrayIndex )
)

( <sr6> NAME 'cimOtherIdentifyingInfoInstanceStructureRule'
  FORM cimOtherIdentifyingInfoInstanceNameForm
)

2.4 Naming considerations
To support naming in the LDAP mapping of the core schema, the attributes orderedCimKeys and orderedCimModelPath are defined. They provide the RDN for directory implementations.

```
( 1.3.6.1.4.1.412.100.1.2.1 NAME 'orderedCimKeys'
  DESC 'The model path for the instance (without propagated
keys). May be used as an RDN'
  SYNTAX DirectoryString SINGLE-VALUE
  EQUALITY octetStringMatch
)

( 1.3.6.1.4.1.412.100.1.2.2 NAME 'orderedCimModelPath'
  DESC 'The model path for the instance (with propagated keys). May
be used as an RDN'
  SYNTAX DirectoryString SINGLE-VALUE
  EQUALITY octetStringMatch
)
```

The value of these attributes are constructed by ordering the CIM keys [formatted as "<className>,<key>=<value>[,<key>=<value>]*"] of the object in the US-ASCII
collation order of the property types. If the DIT structure follows the CIM namespace structure, orderedCimKeys is used and does not include propagated keys. If the DIT structure is different from the CIM namespace structure, then orderedCimModelPath is used as the naming attribute and includes all keys.

2.5 Syntax Conversions

This section discusses specific conversions needed for the core schema. Other mappings may define additional conversion procedures.

2.5.1 CIM String and LDAP DirectoryString

Strings in CIM are stored as UCS-2 characters, while LDAP DirectoryStrings are stored in UTF-8 format. Use RFC 2279 [4] to convert between these two formats.

2.5.2 CIM DateTime and LDAP GeneralizedTime

CIM DateTime is used to store both timestamps and intervals in UCS-2. LDAP GeneralizedTime stores timestamps in a subset of UTF-8. In addition, timezone offset in DateTime are specified in minutes, while GeneralizedTime uses hours and minutes.

Because the core schema only stores timestamps, GeneralizedTime may be used. Time interval conversions will be handled when necessary. Finally, DateTime allows insignificant parts of the date string to be replaced by asterisks (*). To convert from DateTime to GeneralizedTime, the following steps are used:

1. Use RFC 2279 to convert from UCS-2 to UTF-8.
2. Any asterisks in DateTime starting from the rightmost position (microseconds) up to the first date field may be omitted. Any remaining asterisk filled fields must be replaced by zeros.
3. If the UTC offset is +000 it is replaced with a "Z". Otherwise the UTC offset is translated from minutes to hours and minutes format.

To convert from GeneralizedTime to DateTime, the following steps are used:

1. Zero pad or truncate the decimal portion of the seconds to be exactly 6 digits. If there are no decimal seconds specified then the decimal point "." and six asterisks must be used.
2. If the value is in UTC, that is it is followed by a "Z" the "Z" is replaced with +000. Otherwise, the UTC offset is translated from hhmm format to mmm format.
3. If a comma is used as the decimal separator - replace it with a period.
4. Perform character set translation as required.

3. Class Definitions

For efficiency in the LDAP representation, associations are specified as a combination of auxiliary classes and DIT structure rules. Attribute definitions for each class are presented with the object class. Other definitions are also provided when necessary.

While this approach was chosen to minimize the number of DN pointers stored in the schema, some pointer dereferencing is necessary.

3.1 cim23ManagedElement

This abstract class provides a base for non-association classes in CIM. Its addition is one of the major changes between CIM v2.2 and CIM v2.3.
3.2 cim23ManagedSystemElement

This is the base class for the system element hierarchy. Any distinguishable component of a system is a candidate for inclusion in this class. Examples of this are software components, such as files and devices, such as disk drives and controllers, and physical components such as chips and cards.

3.2.1 cim23ManagedSystemElement

7.6.2.1.2.44 NAME cim23ManagedSystemElement
DESC "ManagedElement is an abstract class that provides a common superclass (or top of the inheritance tree) for the non-association classes in the CIM Schema.'
SUP top ABSTRACT
MAY ( cimCaption $ cimDescription $ orderedCimKeys $ orderedCimModelPath )
non-recoverable error has occurred. "Service" describes an Element being configured, maintained or cleaned, or otherwise administered. This status could apply during mirror-resilvering of a disk, reload of a user permissions list, or other administrative task. Not all such work is on-line, yet the Element is neither "OK" nor in another state. Values are "OK", "Error", "Degraded", "Unknown", "Pred Fail", "Starting", "Stopping", "Service", "Stressed", "NonRecover".'

SYNTAX DirectoryString{10} SINGLE-VALUE

( 1.3.6.1.4.1.412.100.2.1.2.1 NAME 'cim23ManagedSystemElement'
  DESC 'CIM_ManagedSystemElement is the base class for the System Element hierarchy. Membership Criteria: Any distinguishable component of a System is a candidate for inclusion in this class. )

3.3 cim23Collection

This abstract class provides a common superclass for classes that represent collections of managed elements.

( 1.3.6.1.4.1.412.100.2.1.2.45 NAME 'cim23Collection'
  DESC 'Collection is an abstract class that provides a common superclass for data elements that represent collections of ManagedElements and its subclasses.'
  SUP cim23ManagedElement ABSTRACT
)

3.4 cim23CollectionOfMSEs

This object allows the grouping of cim23ManagedSystemElement objects for associating settings and configurations. It is abstract to require further definition and semantic refinement in subclasses. As this object does not carry any state or status information, it only represents a grouping or 'bag' of elements. So, it is incorrect to subclass groups that have state/status from this class - an example is cim23RedundancyGroup (which is correctly subclassed from cim23LogicalElement).

Collections typically aggregate 'like' objects, and represent an optimization. Without collections, one is forced to define individual associations, to tie settings and configuration objects to individual cim23ManagedSystemElements. There may be much duplication in assigning the same setting to multiple objects. In addition, using this object allows the determination that the setting and configuration associations are indeed the same for the collection's members. This information would otherwise be obtained by defining the collection in a proprietary way, and then querying the associations to determine if the collection set is completely covered.

( 1.3.6.1.4.1.412.100.2.2.6 NAME 'cimCollectionID'
DESC 'The identification of the Collection object. When subclassed, the CollectionID property can be overridden to be a Key property.'

  SUP top AUXILIARY
  MAY ( cimCollectionRef $ cimCollectionInCollectionRef )
)

3.8 cim23PhysicalElement

This class acts as the base class for any component of a system that has a distinct physical identity. Instances of this class can be defined in terms of labels that can be physically attached to the object. All processes, files, and logical devices are considered not to be physical elements. For example, it is not possible to attach a label to a modem. It is only possible to attach a label to the card that implements the modem. The same card could also implement a LAN adapter. This is an example of a single physical element (the card) hosting more than one logical device.

( 1.3.6.1.4.1.412.100.2.2.10 NAME 'cimCreationClassName'
  DESC 'CreationClassName shows the name of the class or the subclass used in the creation of an instance. When used with the other key properties of this class, this property
allows all instances of this class and its subclasses to be
uniquely identified.'
SYNTAX DirectoryString(256) SINGLE-VALUE
)

( 1.3.6.1.4.1.412.100.2.2.11 NAME 'cimTag'
  DESC 'An arbitrary string that uniquely identifies the
  PhysicalElement and serves as the Element"s key. The Tag
  property can contain information such as asset tag or
  serial number data. The key for PhysicalElement is placed
  high in the object hierarchy to independently
  identify the hardware/entity, regardless of physical
  placement in or on Cabinets, Adapters, etc. For example, a
  hotswappable or removeable component may be taken from its
  containing (scoping) Package and be temporarily unused. The
  object still exists - and may even be inserted
  into a different scoping container. Therefore, the key for
  PhysicalElement is an arbitrary string and is defined
  independently of any placement or location-oriented
  hierarchy.'

3.9 cim23LogicalElement
This class is the base class for all the components of a system that represent abstract system components, such as files, processes, or system capabilities as logical devices.

1.3.6.1.4.1.412.100.2.1.2.6 NAME 'cim23LogicalElement'
DESC 'cim23LogicalElement is a base class for all the components of a System that represent abstract system components, such as Files, Processes, or system capabilities as Logical
3.10 cim22LogicalIdentityAuxClass

This auxiliary class represents an abstract and generic association, showing that two LogicalElements represent different aspects of the same underlying entity. This relationship conveys what could be defined with multiple inheritance. It is restricted to the 'logical' aspects of a ManagedSystemElement. In most scenarios, the identity relationship is determined by the equivalence of keys or some other identifying properties of the related elements. The association should only be used in well understood scenarios. This is why the association is abstract - allowing more concrete definition and clarification in subclasses.

3.11 cim23Configuration

This object allows the grouping of sets of parameters (defined in cim23Setting objects) and dependencies for one or more managed system elements. The configuration object represents a certain behavior, or a desired functional state for the managed system elements. The desired functional state is typically driven by external requirements such as
time or location. For example, to connect to a Mail System from 'home', a dependency on a modem exists, but a dependency on a network adapter exists at 'work'. Settings for the pertinent logical devices can be defined and aggregated by the configuration. Therefore, two 'Connect to Mail' configurations may be defined grouping the relevant dependencies and setting objects.

```
( 1.3.6.1.4.1.412.100.2.1.2.8 NAME 'cim23Configuration'
  DESC 'The Configuration object allows the grouping of sets of parameters (defined in Setting objects) and dependencies for one or more ManagedSystemElements. The Configuration object represents a certain behavior, or a desired functional state for the ManagedSystemElements. The desired functional state is typically driven by external requirements such as time or location. For example, to connect to a Mail System from "home", a dependency on a modem exists, but a dependency on a network adapter exists at "work". Settings for the pertinent LogicalDevices (in this example, POTSModem and NetworkAdapter) can be defined and aggregated by the Configuration. Therefore, two "Connect to Mail" Configurations may be defined grouping the relevant dependencies and Setting objects.'

  OC cim23Configuration
  MUST ( orderedCimKeys )
)

( <sr1> NAME 'cim23ConfigurationStructureRule1'
  FORM cim23ConfigurationNameForm1
)

The following content rule specifies the auxiliary classes that may be attached to cim23Configuration.

```
( 1.3.6.1.4.1.412.100.2.1.2.8 NAME 'cim23ConfigurationContentRule'
  DESC 'The auxiliary classes that may be attached to cim23Configuration'
  AUX ( cim22ConfigurationComponentAuxClass $ cim22ElementConfigurationAuxClass $ cim22CollectionConfigurationAuxClass $ cim22SettingContextAuxClass $ cim22DependencyAuxClass $ cim23MemberOfCollectionAuxClass )
)

3.12 cim22ConfigurationComponentAuxClass

This association aggregates 'lower-level' configuration objects into a 'high-level' configuration. This enables the assembly of complex configurations by grouping together simpler ones.
```

( 1.3.6.1.4.1.412.100.2.2.24 NAME 'cimConfigGroupRef'
  SYNTAX DN
)

3.13 cim22ElementConfigurationAuxClass

This association relates a configuration object to one or more managed system elements. The configuration object represents a certain behavior, or a desired functional state for the associated managed system elements.

```cim22ElementConfigurationAuxClass
NAME 'cim22ElementConfigurationAuxClass'
DESC 'This association relates a Configuration object to one or more ManagedSystemElements. The Configuration object represents a certain behavior, or a desired functional state for the associated ManagedSystemElements. Attribute cimElementRef points to cim22ManagedSystemElement or cim23ManagedSystemElement and attribute cimConfigurationRef points to cim22Configuration or cim23Configuration.'
SUP top AUXILIARY
MAY ( cimElementRef $ cimConfigurationRef )
```
3.14 cim22CollectionConfigurationAuxClass
This auxiliary class relates a Configuration object to one or more CollectionOfMSEs objects. The Configuration object represents a certain behavior, or a desired functional state for the associated collection.

```cim
( 1.3.6.1.4.1.412.100.2.1.1.11
  NAME 'cim22CollectionConfigurationAuxClass'
  DESC 'This association relates a Configuration object to one or more CollectionOfMSEs objects. The Configuration object represents a certain behavior, or a desired functional state for the associated Collection. Attribute cimCollectionRef points to cim22CollectionOfMSEs or cim23CollectionOfMSEs and attribute cimConfigurationRef points to cim22Configuration or cim23Configuration.'
  SUP top AUXILIARY
  MAY ( cimCollectionRef $ cimConfigurationRef )
)
```

3.15 cim23Setting
This class represents configuration-related and operational parameters for one or more managed system element(s). A managed system element may have multiple setting objects associated with it. The current operational values for an element's parameters are reflected by properties in the element itself or by properties in its associations. These properties do not have to be the same values present in the setting object. For example, a modem may have a setting baud rate of 56Kb/sec but be operating at 19.2Kb/sec.

```cim
( 1.3.6.1.4.1.412.100.2.2.28 NAME 'cimSettingID'
  DESC 'The identifier by which the Setting object is known.'
  SYNTAX DirectoryString{256} SINGLE-VALUE
)

( 1.3.6.1.4.1.412.100.2.1.2.12 NAME 'cim23Setting'
  DESC 'The Setting class represents configuration-related and operational parameters for one or more ManagedSystemElement(s). A ManagedSystemElement may have multiple Setting objects associated with it. The current operational values for an Element's parameters are reflected by properties in the Element itself or by properties in its associations. These properties do not have to be the same values present in the Setting object. For example, a modem may have a Setting baud rate of 56Kb/sec but be operating at 19.2Kb/sec.'
  SUP cim23ManagedElement ABSTRACT
  MAY ( cimSettingID )
)
```

3.16 cim22ElementSettingAuxClass
This auxiliary class represents the association between managed system elements and the setting class(es) defined for them.

```cim
( 1.3.6.1.4.1.412.100.2.2.29 NAME 'cimSettingRef'
  DESC 'The Setting object associated with the ManagedSystemElement.'
)
SYNTAX DN

{ 1.3.6.1.4.1.412.100.2.1.1.13 NAME 'cim22ElementSettingAuxClass'
   DESC 'ElementSetting represents the association between ManagedSystemElements and the Setting class(es) defined for them. Attribute cimElementRef points to cim22ManagedSystemElement or cim23ManagedSystemElement and attribute cimSettingRef points to cim22Setting or cim23Setting.'
   SUP top AUXILIARY
   MAY ( cimElementRef $ cimSettingRef )
}

3.17 cim22DefaultSettingAuxClass

This auxiliary class represents the association between a ManagedSystemElement and the single Setting class that is defined to be the default setting for this element.

{ 1.3.6.1.4.1.412.100.2.1.1.14 NAME 'cim22DefaultSettingAuxClass'

This auxiliary class represents the association between products and support access that conveys how support is obtained for the product. This is a many-to-many relationship, implying that various types of support are available for a product, and that the same support object can provide help for multiple products. This class defines two attributes that are self-explanatory.

( 1.3.6.1.4.1.412.100.2.2.65 NAME 'cimSupportRef'
DESC 'Support for the Product.'
SYNTAX DN
)

( 1.3.6.1.4.1.412.100.2.1.1.37 NAME 'cim22ProductSupportAuxClass'
DESC 'cimProductSupport is an association between Product and SupportAccess that conveys how support is obtained for the Product. This is a many-to-many relationship, implying that various types of Support are available for a Product, and that the same Support object can provide help for multiple Products. Attribute cimProductRef points to cim22Product or cim23Product and attribute cimSupportRef points to cim22SupportAccess or cim23SupportAccess.'
SUP top AUXILIARY
MAY ( cimProductRef $ cimSupportRef )
)

3.41 cim23FRU

This class is a vendor-defined collection of products and/or physical elements that is associated with a product for supporting, maintaining or upgrading that product at the customer's location. FRU is an acronym for 'field replaceable unit'.
The following content rule specifies the auxiliary classes that may be attached to cim23FRU.

( 1.3.6.1.4.1.412.100.2.1.1.39 NAME 'cim22ProductFRUAuxClass'
  DESC 'cimProductFRU is an association between Product and FRU that provides information regarding what Product components have been or are being replaced. The association is one to many, conveying that a Product can have many FRUs, and that a particular instance of a FRU is only applied to one (instance of a) Product. Attribute cimProductRef points to

3.42 cim22ProductFRUAuxClass
This auxiliary class provides information regarding what product components have been or are being replaced and uses the previously defined attribute cimProductRefs.

( 1.3.6.1.4.1.412.100.2.1.2.38 NAME 'cim23FRUContentRule'
  DESC 'The auxiliary classes that may be attached to cim23FRU'
  AUX ( cim22ProductFRUAuxClass $ cim22FRUPhysicalElementsAuxClass $ cim23FRUIncludesProductAuxClass $ cim22DependencyAuxClass $ cim23MemberOfCollectionAuxClass )
)
cim22Product or cim23Product and attribute cimFRURef points to cim22FRU or cim23FRU.'
SUP top AUXILIARY
MAY ( cimProductRef $ cimFRURef )

3.43 cim22ProductPhysicalElementsAuxClass
Shows the physical elements that make up a product.

( 1.3.6.1.4.1.412.100.2.2.22 NAME 'cimComponentRef'
  DESC 'The PhysicalElement that is a part of the Product.'
  SYNTAX DN
)

( 1.3.6.1.4.1.412.100.2.1.1.40
  NAME 'cim22ProductPhysicalElementsAuxClass'
  DESC 'Shows the PhysicalElements that make up a Product. Attribute cimProductRef points to cim22Product or cim23Product and attribute cimComponentRef points to cim22PhysicalElement or cim23PhysicalElement.'
  SUP top AUXILIARY
  MAY ( cimProductRef $ cimComponentRef )
)

3.44 cim22FRUPhysicalElementsAuxClass
This auxiliary class shows the physical elements that make up a FRU.

( 1.3.6.1.4.1.412.100.2.1.1.41
  NAME 'cim22FRUPhysicalElementsAuxClass'
  DESC 'Shows the PhysicalElements that make up a FRU. Attribute cimFRURef points to cim22FRU or cim23FRU and attribute cimComponentRef points to cim22PhysicalElement or cim23PhysicalElement.'
  SUP top AUXILIARY
  MAY ( cimFRURef $ cimComponentRef )
)

3.45 cim22FRUIncludesProductAuxClass
This auxiliary class shows that a FRU may be composed of other product(s).

( 1.3.6.1.4.1.412.100.2.1.1.42
  NAME 'cim22FRUIncludesProductAuxClass'
  DESC 'Shows that a FRU may be composed of other Product(s). Attribute cimFRURef points to cim22FRU or cim23FRU and attribute cimComponentRef points to cim22Product or cim23Product.'
  SUP top AUXILIARY
  MAY ( cimFRURef $ cimComponentRef )
)

3.46 cim23SynchronizedAuxClass
This auxiliary class indicates that two logical elements were aligned or made to be equivalent at the specified point in time. Preservation of synchronization is determined by the value of the cimSyncMaintained attribute.
SyncedElement represents another LogicalElement that is synchronized with the entity referenced as SystemElement.'
SYNTAX DN
)

The point in time that the Elements were synchronized.'
SYNTAX generalizedTime SINGLE-VALUE
)

Boolean indicating whether synchronization is maintained.'
SYNTAX boolean SINGLE-VALUE
)

Indicates that two LogicalElements were aligned or made to be equivalent at the specified point in time. If the boolean property SyncMaintained is TRUE, then synchronization of the Elements is preserved. Both like and unlike objects may be synchronized. For example, two WatchDog timers may be aligned, or the contents of a LogicalFile may be synchronized with the contents of a StorageExtent. Both attributes point to cim23LogicalElement objects.'
SUP top AUXILIARY
MAY ( cimSystemElementRef $ cimSyncedElementRef $ cimWhenSynced $ cimSyncMaintained )

5. Acknowledgment
This work is a product of the DMTF LDAP Mapping Working Group and has benefited from many comments and discussions during this groups meetings.
A. Structural Rules

The following table states the structural rules defined in this document.

<table>
<thead>
<tr>
<th>Rule</th>
<th>Structural Class</th>
<th>RDN Attribute</th>
<th>Superior Rules</th>
<th>Defined</th>
</tr>
</thead>
<tbody>
<tr>
<td>&lt;sr1&gt;</td>
<td>cim23Configuration</td>
<td>orderedCimKeys</td>
<td>*</td>
<td>3.11</td>
</tr>
<tr>
<td>&lt;sr2&gt;</td>
<td>cim23Product</td>
<td>orderedCimKeys</td>
<td>*</td>
<td>3.35</td>
</tr>
<tr>
<td>&lt;sr3&gt;</td>
<td>cim23SupportAccess</td>
<td>orderedCimKeys</td>
<td>*</td>
<td>3.39</td>
</tr>
<tr>
<td>&lt;sr4&gt;</td>
<td>cim23FRU</td>
<td>orderedCimKeys</td>
<td>*</td>
<td>3.41</td>
</tr>
<tr>
<td>&lt;sr5&gt;</td>
<td>cimAssociationInstance</td>
<td>cimAssociationName</td>
<td>&lt;sr1&gt;,&lt;sr2&gt;,&lt;sr3&gt;,&lt;sr4&gt;</td>
<td>2.3.1</td>
</tr>
<tr>
<td>&lt;sr6&gt;</td>
<td>cimOtherIdentifyingInfoInstance</td>
<td>arrayIndex</td>
<td>**</td>
<td>2.3.2</td>
</tr>
</tbody>
</table>

* This rule is corresponds to the mapping of a top level object in CIM. This mapping document does not provide suggestions regarding DIT placement of mapped top-level CIM objects.

** The superiors for this rule are not defined in this mapping. In subsequent DMTF CIM mapping documents which define mappings of non-abstract subclasses of CIM_ComputerSystem and CIM_LogicalDevice, it will be possible to define the possible superiors for cimOtherIdentifyingInfoInstance.

B. OID Assignments
