14 management and interoperability. Members and non-members may reproduce DMTF specifications and  
15 documents, provided that correct attribution is given. As DMTF specifications may be revised from time to  
16 time, the particular version and release date should always be noted.

17 Implementation of certain elements of this standard or proposed standard may be subject to third party  
18 patent rights, including provisional patent rights (herein "patent rights"). DMTF makes no representations  
19 to users of the standard as to the existence of such rights, and is not responsible to recognize, disclose,  
20 or identify any or all such third party patent right, owners or claimants, nor for any incomplete or  
21 inaccurate identification or disclosure of such rights, owners or claimants. DMTF shall have no liability to  
22 any party, in any manner or circumstance, under any legal theory whatsoever, for failure to recognize,  
23 disclose, or identify any such third party patent rights, or for such party's reliance on the standard or  
24 incorporation thereof in its product, protocols or testing procedures. DMTF shall have no liability to any  
25 party implementing such standard, whether such implementation is foreseeable or not, nor to any patent  
26 owner or claimant, and shall have no liability or responsibility for costs or losses incurred if a standard is  
27 withdrawn or modified after publication, and shall be indemnified and held harmless by any party  
28 implementing the standard from any and all claims of infringement by a patent owner for such  
29 implementations.

30 For information about patents held by third-parties which have notified the DMTF that, in their opinion,  
31 such patent may relate to or impact implementations of DMTF standards, visit

## Foreword

82 The *Platform Level Data Model (PLDM) Base Specification* (DSP0240) was prepared by the Platform  
83 Management Components Intercommunications (PMCI) Working Group.

84 DMTF is a not-for-profit association of industry members dedicated to promoting enterprise and systems  
85 management and interoperability.

86

## Introduction

87 This document describes base protocol elements of the Platform Level Data Model (PLDM) for the  
88 purpose of supporting platform-level data models and platform functions in a platform management  
89 subsystem. PLDM is designed to be an effective interface and data model that provides efficient access  
90 to low-level platform inventory, monitoring, control, event, and data/parameters transfer functions. For  
91 example, temperature, voltage, or fan sensors can have a PLDM representation that can be used to  
92 monitor and control the platform using a set of PLDM messages. PLDM defines data representations and  
93 commands that abstract the platform management hardware.

# 94 Platform Level Data Model (PLDM) Base Specification

## 95 1 Scope

96 This specification describes base protocol elements of the Platform Level Data Model (PLDM) for the  
97 purpose of supporting platform-level data models and platform functions in a platform management  
98 subsystem. PLDM defines data representations and commands that abstract the platform management  
99 hardware.

100 This specification defines the following elements:

- 101 • the base Platform Level Data Model (PLDM) for various platform functions
- 102 • a common PLDM message format to support platform functions using PLDM

103 The PLDM message common fields support the identification of payload type, message, PLDM type, and  
104 PLDM command/completion codes.

## 105 2 Normative References

106 The following referenced documents are indispensable for the application of this document. For dated  
107 references, only the edition cited applies. For undated references, the latest edition of the referenced  
108 document (including any amendments) applies.

## 129 **3 Terms and Definitions**

130 For the purposes of this document, the following terms and definitions apply.

### 131 **3.1 Requirement Terms and Definitions**

132 This clause defines key phrases and words that denote requirement levels in this specification.

#### 133 **3.1.1**

##### 134 **can**

135 used for statements of possibility and capability, whether material, physical, or causal

#### 136 **3.1.2**

##### 137 **cannot**

138 used for statements of possibility and capability, whether material, physical or causal

#### 139 **3.1.3**

##### 140 **conditional**

141 indicates requirements to be followed strictly to conform to the document when the specified conditions  
142 are met

#### 143 **3.1.4**

##### 144 **mandatory**

145 indicates requirements to be followed strictly to conform to the document and from which no deviation is  
146 permitted

#### 147 **3.1.5**

##### 148 **may**

149 indicates a course of action permissible within the limits of the document

#### 150 **3.1.6**

##### 151 **need not**

152 indicates a course of action permissible within the limits of the document

#### 153 **3.1.7**

##### 154 **optional**

155 indicates a course of action permissible within the limits of the document

#### 156 **3.1.8**

##### 157 **shall**

158 indicates requirements to be followed strictly to conform to the document and from which no deviation is  
159 permitted

#### 160 **3.1.9**

##### 161 **shall not**

162 indicates requirements to be followed strictly to conform to the document and from which no deviation is  
163 permitted

164 **3.1.10**  
165 **should**  
166 indicates that among several possibilities, one is recommended as particularly suitable, without  
167 mentioning or excluding others, or that a certain course of action is preferred but not necessarily required

168 **3.1.11**  
169 **should not**  
170 indicates that a certain possibility or course of action is deprecated but not prohibited

## 171 **3.2 PLDM Terms and Definitions**

172 For the purposes of this document, the following terms and definitions apply.

173 **3.1**  
174 **baseboard management controller**  
175 **BMC**

176 a term coined by the IPMI specifications for the main management controller in an IPMI-based platform  
177 management subsystem. Also sometimes used as a generic name for a motherboard-resident  
178 management controller that provides motherboard-specific hardware monitoring and control functions for  
179 the platform management subsystem.

180 **3.2**  
181 **binary-coded decimal**  
182 **BCD**

183 indicates a particular binary encoding for decimal numbers where each four bits (*nibble*) in a binary  
184 number is used to represent a single decimal digit, and with the least significant four bits of the binary  
185 number corresponding to the least significant decimal digit

186 The binary values `0000b` through `1001b` represent decimal values 0 through 9, respectively. For  
187 example, with BCD encoding a byte can represent a two-digit decimal number where the most significant  
188 nibble (bits 7:4) of the byte contains the encoding for the most significant decimal digit and the least  
189 significant nibble (bits 3:0) contains the encoding for the least significant decimal digit (for example,  
190 `0010_1001b` (0x29) in BCD encoding corresponds to the decimal number 29).

191 **3.3**  
192 **bridge**  
193 generically, the circuitry and logic that connect one computer bus or interconnect to another, allowing an  
194 agent on one to access the other

195 **3.4**  
196 **bus**  
197 a physical addressing domain shared between one or more platform components that share a common  
198 physical layer address space

199 **3.5**  
200 **byte**  
201 an 8-bit quantity. Also referred to as an *octet*.  
202 NOTE: PLDM specifications shall use the term *byte*, not *octet*.

203 **3.6**  
204 **Common Information Model**  
205 **CIM**  
206 the schema of the overall managed environment  
207 It is divided into a *core*, *model*, *common model*, and *extended schemas*. For more information, see  
208 [DSP0004](#).

- 209 **3.7**  
210 **endpoint**  
211 see [MCTP endpoint](#)
- 212 **3.8**  
213 **endpoint ID**  
214 **EID**  
215 see [MCTP endpoint](#)
- 216 **3.9**  
217 **Globally Unique Identifier**  
218 **GUID**  
219 see [UUID](#)
- 220 **3.10**  
221 **Inter-Integrated Circuit**  
222 **I<sup>2</sup>C**  
223 a multiple-master, two-wire, serial bus originally developed by Philips Semiconductor
- 224 **3.11**  
225 **idempotent command**  
226 a command that has the same effect for repeated applications of the same command
- 227 **3.12**  
228 **intelligent management device**  
229 **IMD**  
230 a management device that is typically implemented using a microcontroller and accessed through a  
231 messaging protocol  
232 Management parameter access provided by an IMD is typically accomplished using an abstracted  
233 interface and data model rather than through direct "register-level" access.
- 234 **3.13**  
235 **Intelligent Platform Management Interface**  
236 **IPMI**  
237 a set of specifications defining interfaces and protocols originally developed for server platform  
238 management by the IPMI Promoters Group: Intel, Dell, HP, and NEC
- 239 **3.14**  
240 **Manageability Access Point**  
241 **MAP**  
242 a collection of services of a system that provides management in accordance to CIM profiles and  
243 management protocol specifications published under the DMTF
- 244 **3.15**  
245 **managed entity**  
246 the physical or logical entity that is being managed through management parameters. Examples of  
247 *physical* entities include fans, processors, power supplies, circuit cards, chassis, and so on. Examples of  
248 *logical* entities include virtual processors, cooling domains, system security states, and so on.
- 249 **3.16**  
250 **Management Component Transport Protocol**  
251 **MCTP**  
252 a media-independent transport protocol that was designed for intercommunication of low-level  
253 management messages within a platform management subsystem

- 254 **3.17**  
255 **management controller**  
256 a microcontroller or processor that aggregates management parameters from one or more management  
257 devices and makes access to those parameters available to local or remote software, or to other  
258 management controllers, through one or more management data models  
259 Management controllers may also interpret and process management-related data, and initiate  
260 management-related actions on management devices. While a native data model is defined for PMCI, it is  
261 designed to be capable of supporting other data models, such as CIM, IPMI, and vendor-specific data  
262 models. The microcontroller or processor that serves as a management controller can also incorporate  
263 the functions of a management device.
- 264 **3.18**  
265 **management device**  
266 any physical device that provides protocol terminus for accessing one or more management  
267 parameters  
268 A management device responds to management requests, but it does not initiate or aggregate  
269 management operations except in conjunction with a management controller (that is, it is a *satellite*  
270 device that is subsidiary to one or more management controllers). An example of a simple management  
271 device would be a temperature sensor chip. Another example would be a management controller that has  
272 I/O pins or built-in analog-to-digital converters that monitor state and voltages for a managed entity.
- 273 **3.19**  
274 **management parameter**  
275 a particular datum representing a characteristic, capability, status, or control point associated with a  
276 managed entity  
277 Example management parameters include temperature, speed, volts, on/off, link state, uncorrectable  
278 error count, device power state, and so on.
- 279 **3.20**  
280 **MCTP bridge**  
281 an MCTP endpoint that can route MCTP messages (that are not destined for itself) that it receives on one  
282 interconnect to another without interpreting them  
283 The ingress and egress media at the bridge may be either homogeneous or heterogeneous. Also referred  
284 to in this document as a "bridge".
- 285 **3.21**  
286 **MCTP bus owner**  
287 the entity that is responsible for MCTP EID assignment or translation on the buses of which it is a master  
288 The MCTP bus owner may also be responsible for physical address assignment. For example, for SMBus  
289 bus segments, the MCTP bus owner is also the ARP master. This means the bus owner assigns dynamic  
290 SMBus addresses to devices that require it.
- 291 **3.22**  
292 **MCTP endpoint**  
293 a terminus or origin of an MCTP packet or message  
294 The MCTP endpoint is identified by a value called the MCTP endpoint ID, or EID.
- 295 **3.23**  
296 **message**  
297 see [PLDM message](#)
- 298 **3.24**  
299 **message body**  
300 the portion of a PLDM message that carries the PLDM Type-specific data associated with the message

- 301 **3.25**  
302 **message originator**  
303 the original transmitter (source) of a message targeted to a particular PLDM terminus
- 304 **3.26**  
305 **most significant byte**  
306 **MSB**  
307 the highest order byte in a number consisting of multiple bytes
- 308 **3.27**  
309 **non-idempotent command**  
310 a command that is not an idempotent command
- 311 **3.28**  
312 **nibble**  
313 the computer term for a four-bit aggregation, or half of a byte
- 314 **3.29**  
315 **payload**  
316 the information-bearing fields of a message  
317 These fields are separate from the fields and elements (such as address fields, framing bits, checksums,  
318 and so on) that are used to transport the message from one point to another. In some instances, a given  
319 field may be both a payload field and a transport field.
- 320 **3.30**  
321 **physical transport binding**  
322 refers to specifications that define how a base messaging protocol is implemented on a particular physical  
323 transport type and medium, such as SMBus/I<sup>2</sup>C, PCI Express™ Vendor Defined Messaging, and so on
- 324 **3.31**  
325 **Platform Level Data Model**  
326 **PLDM**  
327 an internal-facing low-level data model that is designed to be an effective data/control source for mapping  
328 under the Common Information Model (CIM)  
329 PLDM defines data structures and commands that abstract platform management subsystem  
330 components. PLDM supports a Type field to distinguish various types of messages and group them  
331 together based on the functions.
- 332 **3.32**  
333 **PLDM command**  
334 a command defined under the PLDM Type that is used for PLDM communications (for example,  
335 commands to control BIOS configuration and attributes transfer, perform SMBIOS data transfer, and  
336 monitor and control sensors)
- 337 **3.33**  
338 **PLDM message**  
339 a unit of communication based on the PLDM Type that is used for PLDM communications
- 340 **3.34**  
341 **PLDM message payload**  
342 a portion of the message body of a PLDM message  
343 This portion of the message is separate from those fields and elements that are used to identify the  
344 payload type, message, PLDM Type, and PLDM command/completion codes.

345 **3.35**346 **PLDM request**347 Same as *PLDM command*. See 3.32.348 **3.36**349 **PLDM request message**

350 a message that is sent to a PLDM terminus to request a specific PLDM operation

351 A PLDM request message is acknowledged with a corresponding response message.

352 **3.37**353 **PLDM response**

354 a response to a specific PLDM request

355 **3.38**356 **PLDM response message**

357 a message that is sent in response to a specific PLDM request message

358 This message includes a "Completion Code" field that indicates whether the response completed normally.

360 **3.39**361 **PLDM terminus**

362 identifies a set of resources within the recipient endpoint that is handling a particular PLDM message

363 **3.40**364 **Platform Management Component Intercommunications**365 **PMCI**366 the name of a working group under the Distributed Management Task Force that is chartered to define  
367 standardized communication protocols, low-level data models, and transport definitions that support  
368 communications with and between management controllers and management devices that form a  
369 platform management subsystem within a managed computer system370 **3.41**371 **point-to-point**372 refers to the case where only two physical communication devices are interconnected through a physical  
373 communication medium

374 The devices may be in a master and slave relationship, or the devices could be peers.

375 **3.42**376 **Universally Unique Identifier**377 **UUID**378 an identifier originally standardized by the Open Software Foundation (OSF) as part of the Distributed  
379 Computing Environment (DCE). UUIDs are created using a set of algorithms that enables them to be  
380 independently generated by different parties without requiring that the parties coordinate to ensure that  
381 generated IDs do not overlap382 In this specification, [RFC4122](#) is used as the base specification for describing the format and generation  
383 of UUIDs. This identifier is also sometimes referred to as a globally unique identifier (GUID).

## 384 **4 Symbols and Abbreviated Terms**

385 The following symbols and abbreviations are used in this document.

### 386 **4.1.**

#### 387 **ACPI**

388 Advanced Configuration and Power Interface

### 389 **4.2.**

#### 390 **ARP**

391 Address Resolution Protocol

### 392 **4.3.**

#### 393 **CIM**

394 Common Information Model

### 395 **4.4.**

#### 396 **DCE**

397 Distributed Computing Environment

### 398 **4.5.**

#### 399 **GUID**

400 Globally Unique Identifier

### 401 **4.6.**

#### 402 **IMD**

403 intelligent management device

### 404 **4.7.**

#### 405 **IPMI**

406 Intelligent Platform Management Interface

### 407 **4.8.**

#### 408 **ISO/IEC**

409 International Organization for Standardization/International Engineering Consortium

### 410 **4.9.**

#### 411 **MC**

412 Management Controller

### 413 **4.10.**

#### 414 **MCTP**

415 Management Component Transport Protocol

### 416 **4.11.**

#### 417 **MSB**

418 most significant byte

### 419 **4.12.**

#### 420 **OSF**

421 Open Software Foundation

- 422 **4.13.**
- 423 **PLDM**
- 424 Platform Level Data Model
- 425 **4.14.**
- 426 **PMCI**
- 427 Platform Management Component Intercommunications
- 428 **4.15.**
- 429 **TID**
- 430 Terminus ID
- 431 **4.16.**
- 432 **UUID**
- 433 Universally Unique Identifier
- 434 **4.17.**
- 435 **WBEM**
- 436 Web-Based Enterprise Management

437 **5 Conventions**

438 The conventions described in the following clauses apply to all of the PLDM specifications.

439 **5.1 Reserved and Unassigned Values**

440 Unless otherwise specified, any reserved, unspecified, or unassigned values in enumerations or other  
 441 numeric ranges are reserved for future definition by the DMTF.

442 Unless otherwise specified, numeric or bit fields that are designated as reserved shall be written as 0  
 443 (zero) and ignored when read.

444 **5.2 Byte Ordering**

445 Unless otherwise specified, for all PLDM specifications byte ordering of multi-byte numeric fields or multi-  
 446 byte bit fields is "Little Endian" (that is, the lowest byte offset holds the least significant byte, and higher  
 447 offsets hold the more significant bytes).

448 **5.3 PLDM Data Types**

449 Table 1 lists the abbreviations and descriptions for common data types that are used in PLDM message  
 450 fields and data structure definitions.

451 **Table 1 – PLDM Data Types**

Data Type	Interpretation
uint8	Unsigned 8-bit binary integer
sint8	Signed 8-bit binary integer
uint16	Unsigned 16-bit binary integer
sint16	Signed 16-bit binary integer
uint32	Unsigned 32-bit binary integer
sint32	Signed 32-bit binary integer

Data Type	Interpretation
uint40	Unsigned 40-bit binary integer
sint40	Signed 40-bit binary integer
uint64	Unsigned 64-bit binary integer
sint64	Signed 64-bit binary integer
string	UCS-2 string
bool8	A Boolean value represented using an unsigned 8-bit binary integer where 0x00 means False, and any non-zero value means True
real32	<p>Also known as "single precision". A 4-byte floating-point format, where:</p> <ul style="list-style-type: none"> <li>[31] – S (sign) bit (1 = negative, 0 = positive)</li> <li>[30:23] – exponent as a binary integer (8 bits)</li> <li>[22:0] – mantissa as a binary integer (23 bits)</li> </ul> <p>Per ANSI/IEEE Standard 754 convention, the value represented is determined as follows:</p> <p>If Exponent = 255 and Mantissa is nonzero, then Value = NaN ("Not a number").</p> <p>If Exponent = 255 and Mantissa is zero and S is 1, then Value = -Infinity.</p> <p>If Exponent = 255 and Mantissa is zero and S is 0, then Value = Infinity.</p> <p>If <math>0 &lt; \text{Exponent} &lt; 255</math>, then <math>\text{Value} = (-1)^S * 2^{(\text{Exponent}-127)} * (1.\text{Mantissa})</math> where "1.Mantissa" is intended to represent the binary number created by prefixing Mantissa with an implicit leading 1 and a binary point.</p> <p>If Exponent = 0 and Mantissa is nonzero, then <math>\text{Value} = (-1)^S * 2^{(-126)} * (0.\text{Mantissa})</math>. These are "unnormalized" values.</p> <p>If Exponent = 0 and Mantissa is zero and S is 1, then Value = -0.</p> <p>* If Exponent = 0 and Mantissa is zero and S is 0, then Value = 0.</p>
real64	<p>Also known as "double-precision". A 8-byte floating-point, where:</p> <ul style="list-style-type: none"> <li>[63] – S (sign) bit (1 = negative, 0 = positive)</li> <li>[62:52] – exponent as a binary integer (11 bits)</li> <li>[51:0] – mantissa as a binary integer (52 bits)</li> </ul> <p>Per IEEE 754 convention, the value represented is determined as follows:</p> <p>If Exponent = 2047 and Mantissa is nonzero, then Value = NaN ("Not a number").</p> <p>If Exponent = 2047 and Mantissa is zero and S is 1, then Value = -Infinity.</p> <p>If Exponent = 2047 and Mantissa is zero and S is 0, then Value = Infinity.</p> <p>If <math>0 &lt; \text{Exponent} &lt; 2047</math>, then <math>\text{Value} = (-1)^S * 2^{(\text{Exponent}-1023)} * (1.\text{Mantissa})</math> where "1.Mantissa" is intended to represent the binary number created by prefixing Mantissa with an implicit leading 1 and a binary point.</p> <p>If Exponent = 0 and Mantissa is nonzero, then <math>\text{Value} = (-1)^S * 2^{(-1022)} * (0.\text{Mantissa})</math>. These are "unnormalized" values.</p> <p>If Exponent = 0 and Mantissa is zero and S is 1, then Value = -0.</p> <p>* If Exponent = 0 and Mantissa is zero and S is 0, then Value = 0.</p>
datetime	A string containing a date-time per <a href="#">DSP0004</a>
char16	16-bit UCS-2 character
enum8	<p>A sequential enumeration, starting from 0 as the default, with optional numeric declarator. The number 8 indicates that the enum is encoded using an 8-bit binary number.</p> <p>Example: enum8 { fred, mary, bob, george } has the value 0 correspond to fred, 1 for mary, 2 for bob, and 3 for george. A value may be explicitly declared such as: enum { fred, mary=2, bob, george }, in which case 0 corresponds to fred, 2 corresponds to mary, and 4 corresponds to george.</p>

Data Type	Interpretation
timestamp104	<p>A binary datetime type formatted as a series of 13 bytes, as follows: (Generally, this format can be mapped to a CIM Datetime timestamp value.)</p> <p>byte 12      UTC and Time resolution</p> <p>                    The CIM Datetime format allows a variable number of significant digits to be represented for the date/time and UTC fields using a '*' character in the string to indicate which contiguous digit positions should be ignored, starting from the least significant position. PLDM generally supports this format by using this byte to present an enumeration for the resolution.</p> <p>          [7:4]      UTC resolution = enum4 {UTCunspecified, minute, 10minute, hour }</p> <p>          [3:0]      Time resolution = enum4 { microsecond, 10microsecond, 100microsecond, millisecond, 10millisecond, 100millisecond, second, 10second, minute, 10minute, hour, day, month, year }</p> <p>bytes 11:10    year as uint16</p> <p>byte 9          month as uint8 (starting with 1)</p> <p>byte 8          day within the month as uint8 (starting with 1)</p> <p>byte 7          hour within the day as uint8 (24-hour representation starting with 0)</p> <p>byte 6          minute within the hour as uint8 (starting with 0)</p> <p>byte 5          seconds within the minute as uint8 (starting with 0)</p> <p>byte 4:2        microsecond within the second as a 24-bit binary integer (starting with 0)</p> <p>bytes 1:0      UTC offset in minutes as sint16</p>
interval72	<p>A binary datetime interval formatted as a series of 9 bytes, as follows: (Generally, this format can be mapped to a CIM Datetime interval value.)</p> <p>byte 8          Time resolution</p> <p>          [7:4]      reserved</p> <p>          [3:0]      enum4 { microsecond, 10microsecond, 100microsecond, 1millisecond, 10millisecond, 100millisecond, second, 10second, minute, hour, day, 10day, 100day }</p> <p>byte 7:6        number of days as uint16 (starting with 1) NOTE: CIM DateTime specifies this as six-digit field.</p> <p>byte 5          hour within the day as uint8 (24-hour representation starting with 0)</p> <p>byte 4          minute within the hour as uint8 (starting with 0)</p> <p>byte 3          seconds within the minute as uint8 (starting with 0)</p> <p>bytes 2:0        microsecond within the second as a 24-bit binary integer (starting with 0)</p>
ver32	<p>A thirty-two-bit encoding of a version number. The encoding of the version number and alpha fields is defined in 5.5.</p> <p>[31:24] = major version number</p> <p>[23:16] = minor version number</p> <p>[15:8] = update version number</p> <p>[7:0] = "alpha" byte</p>
UUID	See 5.4.
bitfield8	A byte with 8 bit fields. Each of these bit fields can be separately defined.
bitfield16	A 2-byte word with 16 bit fields. Each of these bit fields can be separately defined.

## 452 5.4 UUID

453 The format of the ID follows the byte (octet) format specified in [RFC4122](#). [RFC4122](#) specifies the  
454 following four different versions of UUID formats and generation algorithms suitable for use with PLDM:

- 455 • version 1 (0001b) ("time based")
- 456 • version 3 (0011b) "MD5 hash" ("name-based")
- 457 • version 4 (0100b) "Pseudo-random" ("name-based")
- 458 • version 5 "SHA1 hash" ("name-based")

459 The version 1 format is recommended. A UUID value should never change over the lifetime of the device  
460 or software version associated with the UUID.

461 For PLDM, the individual fields within the UUID are transferred in network byte order (most-significant  
462 byte first) per the convention described in [RFC4122](#). For example, Table 2 shows byte order for a UUID in  
463 version 1 format.

464

**Table 2 – Example UUID Format**

Field	UUID Byte	MSB
time low	1	MSB
	2	
	3	
	4	
time mid	5	MSB
	6	
time high and version	7	MSB
	8	
clock seq high and reserved	9	
clock seq low	10	
Node	11	
	12	
	13	
	14	
	15	
	16	

## 465 5.5 Ver32 Encoding

466 The version field is comprised of four bytes referred to as the "major," "minor," "update," and "alpha"  
467 bytes. These bytes shall be encoded as follows:

- 468 • The "major," "minor," and "update" bytes are BCD-encoded, and each byte holds two BCD  
469 digits.
- 470 • The "alpha" byte holds an optional alphanumeric character extension that is encoded using the  
471 ISO/IEC 8859-1 Character Set.

- 472 • The semantics of these fields follow those in [DSP4004](#).
- 473 • The value 0x00 in the alpha field means that the alpha field is not used. Software or utilities that  
474 display the version number should not display any characters for this field.
- 475 • The value 0xF in the most-significant nibble of a BCD-encoded value indicates that the most-  
476 significant nibble should be ignored and the overall field treated as a single-digit value. Software  
477 or utilities that display the number should display only a single digit and should not put in a  
478 leading "0" when displaying the number.
- 479 • A value of 0xFF in the "update" field indicates that the entire field is not present. 0xFF is not  
480 allowed as a value for the "major" or "minor" fields. Software or utilities that display the version  
481 number should not display any characters for this field.

482 EXAMPLE:

483 Version 3.7.10a → 0xF3F71061

484 Version 10.01.7 → 0x1001F700

485 Version 3.1 → 0xF3F1FF00

486 Version 1.0a → 0xF1F0FF61

## 487 5.6 Notations

488 The following notations are used for PLDM specifications:

- 489 • M:N In field descriptions, this will typically be used to represent a range of byte offsets  
490 starting from byte M and continuing to and including byte N ( $M \leq N$ ). The lowest offset  
491 is on the left, and the highest is on the right.
- 492 • rsvd Abbreviation for Reserved. Case insensitive.
- 493 • [4] Square brackets around a number are typically used to indicate a bit offset. Bit offsets  
494 are given as zero-based values (that is, the least significant bit [LSb] offset = 0).
- 495 • [7:5] A range of bit offsets. The most-significant is on the left, and the least-significant is on  
496 the right.
- 497 • 1b A lowercase "b" after a number consisting of 0s and 1s indicates that the number is in  
498 binary format.
- 499 • 0x12A A leading "0x" indicates that the number is in hexadecimal format.

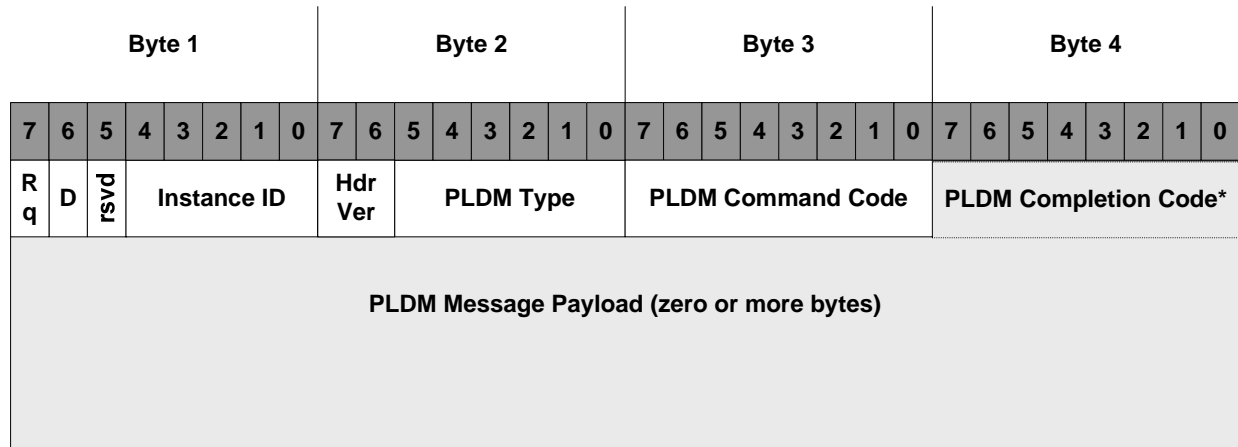

## 500 6 PLDM Base Protocol

501 The PLDM base protocol defines the common fields for PLDM messages and their usage.

502 Though there are command-specific PLDM header fields and trailer fields, the fields for the base protocol  
503 are common for all PLDM messages. These common fields support the identification of payload type,  
504 message, PLDM Type, and PLDM command/completion codes. The base protocol's common fields  
505 include a PLDM Type field that identifies the particular class of PLDM messages.

506 **6.1 PLDM Message Fields**

507 Figure 1 shows the fields that constitute a generic PLDM message. The fields within PLDM messages are  
 508 transferred from the lowest offset first.

509

510 \*The PLDM Completion Code is present only in PLDM response messages.

511 **Figure 1 – Generic PLDM Message Fields**

512 Table 3 defines the common fields for PLDM messages.

513 **Table 3 – PLDM Message Common Fields**

Field Name	Field Size	Description
Rq	1 bit	Request bit. This bit is used to help differentiate between PLDM request messages and other PLDM messages.  This field is set to 1b for PLDM request messages and unacknowledged datagram request messages.  This field is set to 0b for PLDM response messages. See the following row of this table for valid combinations of Rq and D bits.
D	1 bit	Datagram bit. This bit is used to indicate whether the Instance ID field is being used for tracking and matching requests and responses, or just being used for asynchronous notifications.  This field is set to 1b for asynchronous notifications.  This field is set to 0b to indicate that the Instance ID field is being used for tracking and matching requests and responses.  D and Rq bit combinations: 00b – For PLDM response messages 01b – For PLDM request messages 10b – Reserved 11b – For Unacknowledged PLDM request messages or asynchronous notifications
rsvd	1 bit	Reserved

Field Name	Field Size	Description
Instance ID	5 bits	The Instance ID (Instance Identifier) field is used to identify a new instance of a PLDM request to differentiate new PLDM requests that are sent to the same PLDM terminus. The Instance ID field is used to match up a particular instance of a PLDM response message with the corresponding instance of PLDM request message.  If the requester issued a non-idempotent command, it shall complete any retries for that command before issuing a command with a new Instance ID.
Hdr Ver	2 bits	The Hdr Ver (Header Version) field identifies the header format. For this version of the specification, the value is set to 00b. This version applies to the PLDM message format.
PLDM Type	6 bits	The PLDM Type field identifies the type of PLDM that is being used in the control or data transfer carried out using this PLDM message. The PLDM Type field allows PLDM messages to be grouped together based on functions. See <a href="#">DSP0245</a> for the definitions of PLDM Type values.
PLDM Command Code	8 bits	For PLDM request messages, the PLDM Command Code field identifies the type of operation the message is requesting. The PLDM command code values are defined per PLDM Type. The PLDM Command Code that is sent in a PLDM request message shall be returned in the corresponding PLDM response message.
PLDM Message Payload	Variable	The PLDM message payload is zero or more bytes that are specific to a particular PLDM Message. By convention, the PLDM Message formats are described using tables with the first byte of the payload identified as byte 0.  NOTE: The baseline PLDM message payload size is PLDM Type-specific.
PLDM Completion Code	8 bits	The PLDM Completion Code field provides the status of the operation. This field is the first byte of the PLDM Message Payload for PLDM response messages and is not present in PLDM request messages. This field indicates whether the PLDM command completed normally. If the command did not complete normally, then the completion code provides additional information regarding the error condition. The PLDM Completion Code can be generic or PLDM Type-specific.

## 514 6.2 Generic PLDM Completion Codes (PLDM\_BASE\_CODES)

515 The command completion code fields are used to return PLDM operation results in the PLDM response  
516 messages. On a successful completion of a PLDM operation, the specified response parameters (if any)  
517 shall also be returned in the response message. For a PLDM operation resulting in an error, unless  
518 otherwise specified, the responder shall not return any additional parametric data and the requester shall  
519 ignore any additional parameter data provided in the response.

520 Table 4 defines the generic completion codes for the PLDM commands. PLDM Type-specific command  
521 completion codes are defined in the respective PLDM specification. Unless otherwise specified in a  
522 PLDM specification, specific error completion codes are optional. If a PLDM command completes with an  
523 error, the generic failure message (ERROR), an appropriate generic error completion code from Table 4,  
524 or a PLDM Type-specific error completion code shall be returned. For an unsupported PLDM command,  
525 the ERROR\_UNSUPPORTED\_PLDM\_CMD completion code shall be returned unless the responder is in  
526 a transient state (not ready), in which it cannot process the PLDM command. If the responder is in a  
527 transient state, it may return the ERROR\_NOT\_READY completion code.

528

**Table 4 – Generic PLDM Completion Codes (PLDM\_BASE\_CODES)**

Value	Name	Description
0x00	SUCCESS	The PLDM command was accepted and completed normally.
0x01	ERROR	This is a generic failure message to indicate an error processing the corresponding request message. It should not be used when a more specific error code applies.
0x02	ERROR_INVALID_DATA	The PLDM request message payload contained invalid data or an illegal parameter value.
0x03	ERROR_INVALID_LENGTH	The PLDM request message length was invalid. (The PLDM request message body was larger or smaller than expected for the particular PLDM command.)
0x04	ERROR_NOT_READY	The Receiver is in a transient state where it is not ready to process the corresponding PLDM command.
0x05	ERROR_UNSUPPORTED_PLDM_CMD	The command field in the PLDM request message is unspecified or not supported for this PLDM Type. This completion code shall be returned for any unsupported command values received.
0x20	ERROR_INVALID_PLDM_TYPE	The PLDM Type field value in the PLDM request message is invalid or unsupported.
0x80-0xFF	COMMAND_SPECIFIC	This range of completion code values is reserved for values that are specific to a particular PLDM request message. The particular values (if any) and their definition is provided in the specification for the particular PLDM command.
All other	Reserved	Reserved

### 529 **6.3 Concurrent PLDM Command Processing**

530 This section describes the specifications and requirements for handling concurrent overlapping PLDM  
531 requests.

#### 532 **6.3.1 Requirements for Responders**

533 A PLDM terminus is not required to process more than one request at a time (that is, it can be "single  
534 threaded" and does not have to accept and act on new requests until it has finished responding to any  
535 previous request).

536 A responder that is not ready to accept a new request can either silently discard the request, or it can  
537 respond with an `ERROR_NOT_READY` message completion code.

538 The PLDM does not restrict any specific model for the number of requesters or responders that can  
539 communicate simultaneously. The PLDM specification allows an implementation to have a responder that  
540 handles one request at a time and to not maintain contexts for multiple requests or multiple requesters.

541 If a PLDM terminus is working on a request from a requester, then the PLDM terminus shall be able to  
542 process (or queue up processing) and send the response independently from sending its own request.

543 When a responder allows simultaneous communications with multiple requesters, the requirements on  
 544 the responder are as follows:

- 545 • The responder shall use the following fields to track a PLDM request: the transport address  
 546 (which is transport-binding specific, for example EID for MCTP transport) of the requester,  
 547 PLDM Type, PLDM Command Code, and Instance ID of the PLDM request.
- 548 • If the responder runs out of internal resources, it may fail PLDM requests.

549 **6.3.2 Requirements for Requesters**

550 A PLDM terminus that issues PLDM requests to another PLDM terminus shall wait until it either gets the  
 551 response to a particular request, times out waiting for the response, or receives an indication that  
 552 transmission of the particular request failed, before issuing a new PLDM request.

553 A PLDM terminus that issues PLDM requests is allowed to have multiple simultaneous requests  
 554 outstanding to *different* responders.

555 A PLDM terminus that issues PLDM requests should be prepared to handle the order of responses that  
 556 may not match the order in which the requests were sent (that is, it should not automatically assume that  
 557 a response that it receives is in the order in which the request was sent). It should check to see that the  
 558 PLDM Type, PLDM Command Code, and Instance ID values in the response match up with a  
 559 corresponding outstanding command before acting on any parameters returned in the response.

560 The timing specifications shown in Table 5 are specific to PLDM request messages. The PLDM  
 561 responses are not retried. A “try” or “retry” of a request is defined as a complete transmission of the  
 562 PLDM request message.

563 **Table 5 – Timing Specifications for PLDM Messages**

Timing Specification	Symbol	Min	Max	Description
Number of request retries	PN1	2	See "Description"	Total of three tries, minimum: the original try plus two retries. The maximum number of retries for a given request is limited by the requirement that all retries shall occur within PT3 <sub>Max</sub> of the initial request.
Request-to-response time	PT1	–	100 msec	This interval is measured at the responder from the end of the reception of the PLDM request to the beginning of the transmission of the response. This requirement is tested under the condition where the responder can successfully transmit the response on the first try.
Time-out waiting for a response	PT2	PT1 <sub>Max</sub> + 2*PT4 <sub>Max</sub>	PT3 <sub>Min</sub> – 2*PT4 <sub>Max</sub>	This interval is measured at the requester from the end of the successful transmission of the PLDM request to the beginning of the reception of the corresponding PLDM response. This interval at the requester sets the minimum amount of time that a requester should wait before retrying a PLDM request.  Note: This specification does not preclude an implementation from adjusting the minimum time-out waiting for a response to a smaller number than PT2 based on measured response times from responders. The mechanism for doing so is outside the scope of this specification.

Timing Specification	Symbol	Min	Max	Description
Instance ID expiration interval	PT3	5 sec <sup>[1]</sup>	6 sec	This is the interval after which the Instance ID for a given response will expire and become reusable if a response has not been received for the request. This is also the maximum time that a responder tracks an Instance ID for a given request from a given requester.
Transmission Delay	PT4	–	100 ms	Time to take into account transmission delay of a PLDM Message. Measured as the time between the end of the transmission of a PLDM message at the transmitter to the beginning of the reception of the PLDM message at the receiver.
NOTE: <sup>[1]</sup> If a requester is reset, it may produce the same Instance ID for a request as one that was previously issued. To guard against this, it is recommended that Instance ID expiration be implemented. Any request from a given requester that is received more than PT3 seconds after a previous, matching request should be treated as a new request, not a retry.				

## 564 7 PLDM Messaging Control and Discovery Commands

565 The PLDM base definition supports a PLDM Type field that allows the commands to be grouped using a  
566 PLDM Type. This section contains detailed descriptions for PLDM messages that are used for control and  
567 discovery operations. The PLDM commands for PLDM messaging control and discovery are also defined  
568 in this section.

569 Table 6 defines the PLDM command codes for PLDM messaging control and discovery.

570 **Table 6 – PLDM Messaging Control and Discovery Command Codes**

Command	Code Value	Requirement	Section
SetTID	0x01	Optional	See 7.1.1.
GetTID	0x02	Mandatory	See 7.1.2.
GetPLDMVersion	0x03	Mandatory	See 7.2.
GetPLDMTypes	0x04	Mandatory	See 7.3.
GetPLDMCommands	0x05	Mandatory	See 7.4.

### 571 7.1 PLDM Terminus

572 A PLDM Terminus is defined as the point of communication termination for PLDM messages and the  
573 PLDM functions associated with those messages. Given a PLDM terminus, a mechanism is required that  
574 can uniquely identify each terminus so that the semantic information can be bound to that identification.  
575 The Terminus ID (TID) is a value that identifies a PLDM terminus. TIDs are used in PLDM messages  
576 when it is necessary to identify the PLDM terminus that is the source of the PLDM Message. TIDs are  
577 defined within the scope of PLDM Messaging.

#### 578 7.1.1 SetTID Command

579 The SetTID command is used to set the Terminus ID (TID) for a PLDM Terminus. This command is  
580 typically only used by the PLDM Initialization Agent function. The command format is shown in Table 7.

581

**Table 7 – SetTID Command Format**

Byte	Type	Request Data
0	uint8	<b>TID</b> Special value: 0x00, 0xFF = reserved.
Byte	Type	Response Data
0	enum8	<b>completionCode</b> Possible values: { PLDM_BASE_CODES }

582 **7.1.2 GetTID Command**

583 The GetTID command is used to retrieve the present Terminus ID (TID) setting for a PLDM Terminus.  
584 The command format is shown in Table 8.

585

**Table 8 – GetTID Command Format**

Byte	Type	Request Data
0	–	No request data
Byte	Type	Response Data
0	enum8	<b>completionCode</b> possible value: { PLDM_BASE_CODES }
1	uint8	<b>TID</b> special value: 0x00 – Unassigned TID, 0xFF – reserved

586 **7.2 GetPLDMVersion**

587 The GetPLDMVersion command can be used to retrieve the PLDM base specification versions that the  
588 PLDM terminus supports, as well as the PLDM Type specification versions supported for each PLDM  
589 Type. The format of the request and response message parameters for this command is shown in  
590 Table 9.

591 More than one version number can be returned for a given PLDM Type by the GetPLDMVersion  
592 command. This enables the command to be used for reporting different levels of compatibility and for  
593 backward compatibility with different specification versions. The individual specifications for the given  
594 PLDM Type define the requirements for which version number values should be used for that PLDM  
595 Type. Those documents define which earlier version numbers, if any, shall also be listed.

596 The command returns a completion code that indicates whether the PLDM Type number passed in the  
597 request is supported. This enables the command to also be used to query the endpoint for whether it  
598 supports a given PLDM Type.

599

**Table 9 – GetPLDMVersion Request and Response Message Format**

Byte	Type	Request Data
0:3	uint32	<b>DataTransferHandle</b> This field is a handle that is used to identify PLDM version data transfer. This handle is ignored by the responder when the TransferOperationFlag is set to GetFirstPart.
4	enum8	<b>TransferOperationFlag</b> This field is an operation flag that indicates whether this is the start of the transfer. Value: {GetNextPart=0x00, GetFirstPart=0x01}
5	uint8	<b>PLDMType</b> This field identifies the PLDM Type whose version information is being requested. See <a href="#">DSP0245</a> for valid PLDMType values.
Byte	Type	Response Data
0	enum8	<b>CompletionCode</b> possible values: { PLDM_BASE_CODES, INVALID_DATA_TRANSFER_HANDLE=0x80, INVALID_TRANSFER_OPERATION_FLAG=0x81, INVALID_PLDM_TYPE_IN_REQUEST_DATA=0x83 }
1:4	uint32	<b>NextDataTransferHandle</b> This field is a handle that is used to identify the next portion of PLDM version data transfer.
5	enum8	<b>TransferFlag</b> This field is the transfer flag that indicates what part of the transfer this response represents. Possible values: {Start=0x01, Middle=0x02, End=0x04, StartAndEnd = 0x05}
Variable	–	<b>Portion of PLDMVersionData</b> (contains one or more version fields as described in Table 10) See Table 10 for the format.

600

**Table 10 – PLDM Representation of PLDMVersionData**

Byte	Type	Field
0:3	ver32	<b>Version[0]</b> This field is the first entry of the version supported for the specified PLDM type.
...	...	...
4*(N-1):4*N-1	ver32	<b>Version[N-1]</b> This field is the N <sup>th</sup> entry of the version supported for the specified PLDM type.
4*N:4*N+3	uint32	<b>PLDMVersionDataIntegrityChecksum</b> Integrity checksum on the PLDM version data. It is calculated starting at the first byte of the PLDM representation of PLDMVersionData.  For this specification, CRC-32 algorithm with the polynomial $x^{32} + x^{26} + x^{23} + x^{22} + x^{16} + x^{12} + x^{11} + x^{10} + x^8 + x^7 + x^5 + x^4 + x^2 + x + 1$ (same as the one used by IEEE 802.3) shall be used for the integrity checksum computation. The CRC computation involves processing a byte at a time with the least significant bit first.

601 This command is defined in such a manner that it allows the PLDM version data to be transferred using a  
 602 sequence of one or more command or response messages. When more than one command is used to  
 603 transfer the PLDM version data, the response messages contain the non-overlapping contiguous portions  
 604 of PLDM version data as defined in Table 10. By combining the portions of PLDM version data from the  
 605 response messages, the entire PLDM version data can be reconstructed.

606 The version of this PLDM base specification shall be 1.0.0 (major version number 1, minor version  
 607 number 0, update version number 0, and no alpha version).

608 This is reported using the encoding as: 0xF1F0F000.

### 609 7.3 GetPLDMTypes

610 The GetPLDMTypes command enables management controllers to discover the PLDM type capabilities  
 611 supported by the PLDM terminus and get a list of the PLDM types that are supported. The request and  
 612 response parameters for this message are listed in Table 11.

613 The response to this command may be specific according to which transport endpoint over which the  
 614 request was received (that is, a device that supports a given PLDM Type on a transport endpoint may not  
 615 support that PLDM Type equally across all the transport endpoints that connect to the device).

616 **Table 11 – GetPLDMTypes Request and Response Message Format**

Byte	Type	Request Data
-	-	None
Byte	Type	Response Data
0	enum8	<b>CompletionCode</b> Possible values: { PLDM_BASE_CODES}
1:8	bitfield8[8]	<b>PLDMTypes</b> Each bit represents whether a given PLDM Type is supported: 1b = PLDM Type is supported. 0b = PLDM Type is not supported. For bitfield8[N], where N = 0 to 7 [7] – PLDM Type N*8+7 Supported [.] – ... [1] – PLDM Type N*8+1 Supported [0] – PLDM Type N*8+0 Supported

### 617 7.4 GetPLDMCommands

618 The GetPLDMCommands command enables management controllers to discover the PLDM command  
 619 capabilities supported by the PLDM terminus for a specific PLDM Type and version as a responder. The  
 620 request and response parameters for this message are listed in Table 12.

621 The response to this command may be specific according to which transport endpoint over which the  
 622 request was received (that is, a device that supports a given PLDM Type on a transport endpoint may not  
 623 support that PLDM Type equally across all the transport endpoints that connect to the device).

624

**Table 12 – GetPLDMCommands Request and Response Message Format**

Byte	Type	Request Data
0	uint8	<b>PLDMType</b> This field identifies the PLDM Type for which command support information is being requested. See <a href="#">DSP0245</a> for valid PLDMType values.
1:4	ver32	<b>Version</b> This field identifies the version for the specified PLDM Type.
Byte	Type	Response Data
0	enum8	<b>CompletionCode</b> Possible values: { PLDM_BASE_CODES, INVALID_PLDM_TYPE_IN_REQUEST_DATA=0x83 INVALID_PLDM_VERSION_IN_REQUEST_DATA=0x84 }
1:32	bitfield8[32]	<b>PLDMCommands</b> (up to 256 commands supported for the specified PLDM Type) Each bit represents whether a given PLDM command is supported: 1b = PLDM command is supported. 0b = PLDM command is not supported. For bitfield8[N], where N = 0 to 31 [7] – PLDM Command N*8+7 Supported [.] – ... [1] – PLDM Command N*8+1 Supported [0] – PLDM Command N*8 Supported

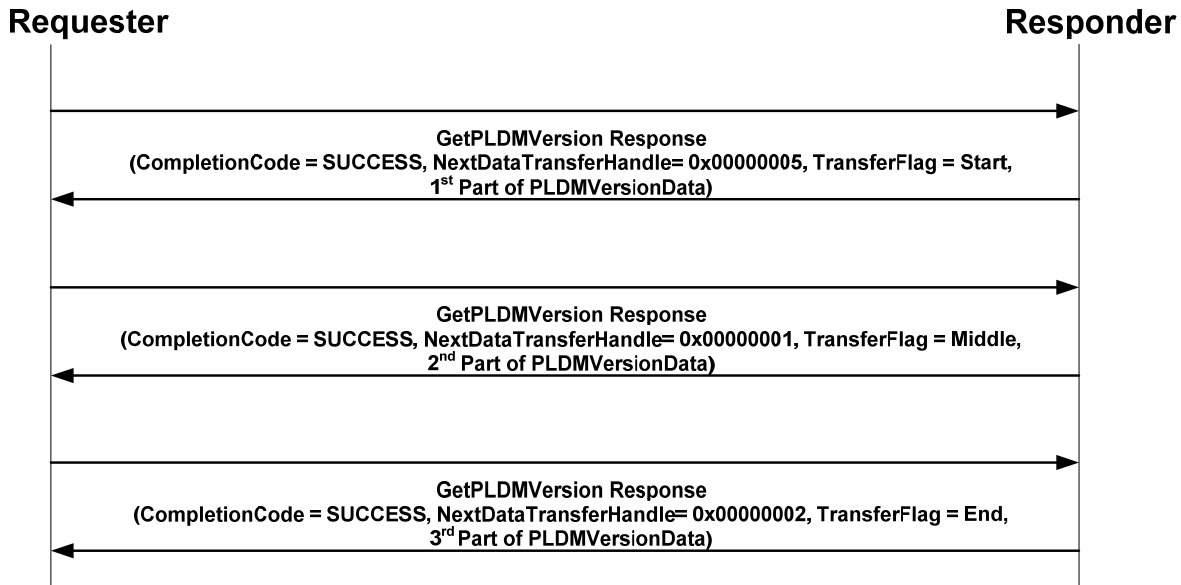

## 625 8 PLDM Messaging Control and Discovery Examples

626 The GetPLDMVersion command (see 7.2) for transferring PLDM version data supports multipart  
 627 transfers. The GetPLDMVersion command uses flags and data transfer handles to perform multipart  
 628 transfers. The following requirements apply to the usage of TransferOperationFlag, TransferFlag, and  
 629 DataTransferHandle for a given data transfer:

- 630 1) For initiating a data transfer (or getting the first part of data) by using a Get\* command, the  
 631 TransferOperationFlag shall be set to GetFirstPart in the request of the Get\* command.
- 632 • For transferring any part of the data other than the first part by using a Get\* command, the  
 633 TransferOperationFlag shall be set to GetNextPart and the DataTransferHandle shall be  
 634 set to the NextDataTransferHandle that was obtained in the response of the previous Get\*  
 635 command for this data transfer.
  - 636 • The TransferFlag specified in the response of a Get\* command has the following  
 637 meanings:
    - 638 – Start, which is the first part of the data transfer.

- 639           – Middle, which is neither the first nor the last part of the data transfer.
- 640           – End, which is the last part of the data transfer.
- 641           – StartAndEnd, which is the first and the last part of the data transfer.
- 642           • The requester shall consider a data transfer complete when the TransferFlag in the
- 643            response of a Get\* command is set to End or StartAndEnd.

644 EXAMPLE 1: The example in Figure 2 shows how multipart transfers can be performed using the generic mechanism  
 645 defined in the GetPLDMVersion command. In Figure 2, the PLDM version data is transferred in three  
 646 parts. Figure 2 shows the flow of the data transfer.

647

648 **Figure 2 – Example of Multipart PLDM Version Data Transfer Using the GetPLDMVersion**  
 649 **Command**

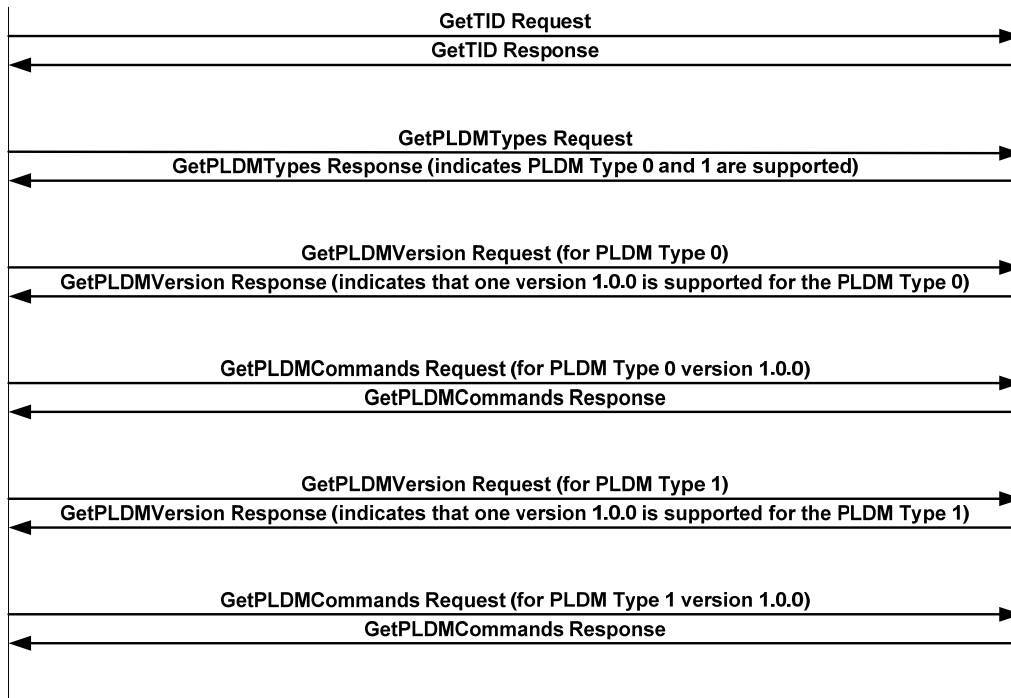

650 EXAMPLE 2: Figure 3 shows an example sequence of steps performed by a requester to discover the PLDM versions  
 651 and types supported by the responder as well as the commands supported for each PLDM type.

652 In the example, the following steps are performed by the requester:

- 653           1) The requester first uses the GetTID command to get the PLDM Terminus ID of the responder.
- 654           2) The requester then uses GetPLDMTypes to discover the PLDM types supported by the  
 655 responder. (In the example shown in Figure 3, the responder supports two PLDM types, PLDM  
 656 Type 0 and PLDM Type 1.)
- 657           3) For each PLDM type that is supported by the responder, the requester uses GetPLDMVersion  
 658 and GetPLDMCommands to discover the supported versions of the specifications for the PLDM  
 659 type and the supported PLDM commands for the specific PLDM version and type. In this  
 660 example, the responder supports only one version of the specification (1.0.0) for each PLDM  
 661 Type.
