1 Overview

The Redfish standard comprises a set of specifications maintained by the Redfish Forum, a working group within DMTF. The standard defines a protocol that uses RESTful interfaces to provide access to data and operations associated with the management of systems and networks. One of the strengths of the Redfish protocol is that it works with a wide range of servers: from stand-alone servers to rack-mount and bladed environments to large-scale data centers and cloud environments.

The Redfish standard addresses several key issues for infrastructures that require scalability. Large infrastructures often consist of many simple servers of different makes and types. This hyper-scale usage model requires a new approach to systems management. The Redfish protocol addresses these needs by providing a standard protocol based on out-of-band systems management.

With these goals in mind, the Redfish protocol was designed as an open-industry standard to meet scalability requirements in multi-vendor deployments. It easily integrates with commonly used tools, using RESTful interfaces to perform operations and using JSON for data payloads.

1.1 Who should read this document?

This document is intended primarily as a reference for schema authors to locate existing property definitions within the Redfish schema. End users and other consumers of Redfish data may also use this guide to look up property definitions without regard to their location in the schema.

1.2 How can I provide feedback?

Feedback on all Redfish specifications and documents is encouraged. Feedback can be directed to DMTF and the Redfish Forum by the following means:

- **DMTF Feedback Portal:** [https://www.dmtf.org/standards/feedback](https://www.dmtf.org/standards/feedback) Formal submission portal for enhancements or proposals to DMTF and the Redfish Forum.

1.3 Where can I find more information?

The following web sites provide more information about the Redfish standard:

- **Redfish Developer Hub**

  Resources for developers who use Redfish to build applications. Contains an interactive schema explorer, hosted schema, and other links.
• **Redfish Specification Forum**
  DMTF Redfish-monitored user forum. Answers questions about Redfish-related topics.

• **DMTF GitHub repositories**
  Open source tools and libraries for working with Redfish.

• **Redfish standards**
  Schemas, specifications, mockups, white papers, FAQ, educational material, and more.

• **DMTF Redfish Forum**
  Working group that maintains the Redfish standard. Site lists member companies, future work and schedules, charter, and information about joining.

The following documents are part of the Redfish development effort. They can be accessed or downloaded from DMTF’s Redfish Standards web site: [http://www.dmtf.org/standards/redfish](http://www.dmtf.org/standards/redfish)

- DSP0218 - Platform Level Data Model (PLDM) for Redfish Device Enablement Specification - Binary-encoded JSON (BEJ) and dictionary-based mapping of Redfish schemas and properties into PLDM messages.
- DSP0268 - Redfish Data Model Specification - Normative descriptions and additional text for every schema defined in DSP8010 and example payloads for every resource.
- DSP0270 - Redfish Host Interface Specification - “In-band” or “OS-based” Redfish host interface.
- DSP0272 - Redfish Interoperability Profiles Specification - Structure and JSON document that is used to define and publish an interoperability profile that checks an implementation's conformance to a defined minimum set of functionality.
- DSP2043 - Redfish Mockups Bundle - Set of mockups that can be used as sample output from GETs from a Redfish service. Informative in nature, it was used to develop the schema. A person can set up an NGINX or similar server and configure it to output JSON format and then use this directory for demonstration purposes.
- DSP2044 - Redfish White Paper - Non-normative document helping those new to Redfish understand how to interact with the Redfish service and understand common functions and tasks.
- DSP2046 - Redfish Resource and Schema Guide - Informative documentation regarding common Redfish resource properties and a listing of properties that can be found in each of the Redfish resources.
- DSP2053 - Redfish Property Guide - Informative documentation providing an index to individual

property definitions across all Redfish schema.

- DSP2065 - Redfish Message Registry Guide - Informative documentation providing details regarding the messages defined in Redfish standard message registries.

- DSP8010 - Redfish Schema - Redfish schema definitions. These files are normative in nature and are normatively referenced by the Redfish Specification. The three schema formats are CSDL (OData Common Schema Definition Language format, which is in XML), JSON Schema, and OpenAPI schema. These schema definitions should be functionally equivalent, thus specifying the schema in two different languages.

- DSP8011 - Redfish Standard Registries - Redfish registry definitions. This bundle of Redfish registries includes message registries used for Redfish-defined messages including events and privilege maps.

- DSP8013 - Redfish Interoperability Profiles Bundle - Bundle of published Redfish interoperability profile documents and supporting schema and sample documents used for creating profiles.
2 Using this guide

Every Redfish response consists of a JSON payload containing properties that are strictly defined by a schema for that resource. The schema that defines a resource can be determined from the value of the `@odata.type` property returned in every Redfish response. This guide details the definitions for every Redfish standard property defined in DMTF-published Redfish schemas.

The property-level details include:

<table>
<thead>
<tr>
<th>Column</th>
<th>Purpose</th>
</tr>
</thead>
<tbody>
<tr>
<td>Property Name</td>
<td>The name of the JSON property as it appears, case sensitive, in the JSON payload.</td>
</tr>
<tr>
<td>Defined in Schemas</td>
<td>The names of the Redfish schemas where this property is defined, and therefore in which resources it may appear. For properties that appear within embedded JSON objects, the object name appears in parentheses.</td>
</tr>
<tr>
<td>Type</td>
<td>The JSON data types for the property, which can include boolean, number, string, or object. String types that use defined enumerations state <code>(enum)</code>. Number types state units, where used.</td>
</tr>
<tr>
<td>Description</td>
<td>The description of the property, as copied directly from the schema <code>Description</code> definition, or, for properties that appear in multiple schemas, a general description of its usage in any of the listed schemas.</td>
</tr>
</tbody>
</table>

**MarkedECN**

- **MarkedECN**
  - Integer
  - The number of packets with the Congestion ECN bit set.

**MasterPassphraseAttemptCountReached**

- **MasterPassphraseAttemptCountReached**
  - Boolean
  - An indication of whether an incorrect master passphrase attempt count has been reached.

**MasterPassphraseEnabled**

- **MasterPassphraseEnabled**
  - Boolean
  - An indication of whether the master passphrase is enabled for this region.

**MaxAllowableOperatingValue**

- **MaxAllowableOperatingValue**
  - Integer (Celsius)
  - Maximum allowable operating temperature for this equipment.

**MaxAuthorizedDevices**

- **MaxAuthorizedDevices**
  - Integer
  - The maximum number of devices authorized by the license.

**MaxBandwidthGbps**

- **MaxBandwidthGbps**
  - Number (Gbit/s)
  - The maximum internal bandwidth of this switch as currently configured.

**MetricType**

- **Triggers**: string (enum)
  The metric type of the trigger.

**MetricDefinition**

- **MetricDefinition**: string (enum)
  The type of metric.

**MetricValue**

- **MetricReport (MetricValues), TelemetryService (Actions > SubmitTestMetricReport (Action) > GeneratedMetricReportValues)**: string
  The metric value, as a string.

**MetricValues**

- **MetricReport**: array
  An array of metric values for the metered items of this metric report.

**MFABypass**

- **ManagerAccount**: object
  The multi-factor authentication bypass settings for this account.

4 Redfish documentation generator

This document was created using the Redfish Documentation Generator utility, which uses the contents of the Redfish schema files (in JSON schema format) to automatically generate the bulk of the text. The source code for the utility is available for download at DMTF’s GitHub repository located at https://www.github.com/DMTF/Redfish-Tools.
